COPYING A MASTER DISK WHEN USING ONE DISK DRIVE

DISK MANAGER 2

Steps	Menu Options #	Display	Entry
1	#4	SINGLE DISK PROCESSING	
2	#2	DISK COMMANDS	
3	#2	BACKUP DISK	
4		SELECTIVE (Y/N)?	N
5		MASTER DISK (1-3)?	1
6		DISKNAME =	
7		COPY DISK (1-3)?	1
8		LOAD COPY DISK	FCTN 6
9		LOAD MASTER DISK	FCTN 6
10		LOAD COPY DISK	FCTN 6

NOTE: During steps 9 and 10, a catalog of the program or file being copied appears in the middle of the screen. These two steps are performed repeatedly until all programs and data files have been copied.

To insure proper functionability of the backup disk, give the disk the same name as the master disk. A prime example of this is the problem with Microsoft Multiplan, it will not recognize the backup diskette if a different disk name was used in the copying process.

Also during the process of making a backup disk the screen will display the next step to be entered while the disk drive is still turning. Do not remove the master disk or the copy disk from the drive until the red indicator light goes off. Wait until the drive has stopped before proceeding with the copying process
