SPIRIT OF 99

TIBBS

By Gale S Ringley

The Spirit Of 99 TI BBS is now online 24 hours everyday. The modem number is (614)-451-0880. I guess many of you were expecting this article to be all about the trials and tribulations of starting and running a computer bulletin board.. but due to the trials and tribulations of running a computer bulletin board (hereafter referred to as "BBS") I have not had the time to write such an article. Hopefully I will have that ready by our next issue. The prime thrust of this article is a description of the BBS, and a simple method of how to call it from your home. First, the features.

A BBS is a place where you can leave public and private messages to other users of the BBS. We presently allow messages of 12 lines of 40 characters in size. We also offer text files on various subjects. These include all of the local BBS's all known BBS's in the world that are run on a TI99/4A, programming tips for the 4A, the list goes on and on.

There is the Micro Stuph Online Store, where you can order things for your TI-99 from your home. We will even be supporting direct file transfers using the TRANS feature

of Terminal Emulator II! Now I bet you are saying all this must be difficult to learn and use, I bet more than a few of you who have modems have not even taken them out of the box yet!

To logon to the Spirit Of 99 (with a TI Phone Modem), do the following:

1 Connect the modem to your RS-232, and plug it in.

2 Insert the Terminal Emulator II module in to the module port.

3 Turn on the P-box, the monitor, and the computer

4 Press the [3] key twice. If you have a disk drive, the drive light will come on and the drive will spin. Don't worry about it.

5 You should now see a white screen with a green cursor in the upper left hand corner. If not, then redo the steps and insure that all is hooked together properly.

6 There are two switches on the modem. With the words "Phone Modem" facing you, reach across the modem and move both switches to the far right. You should always set them this way.

7 Dial 451-0880. If you get a busy signal, try again later. If the phone is answered, normally after the first ring, you will hear a high pitched tone.

8 Apply your phone handset to the modem cord to the rear just like the little picture below the ready light.

You will then see your cursor spring to life! Follow the online instructions and have fun!

See You Later

TIPS FROM THE TIGERCUB

Copyright 1984, Tigercub Software, 156 Collingwood Ave., Columbus Ohio 43213. May be reprinted by non-profit users' groups, with credit to Tigercub Software.

These Tips are distributed to Users' Groups in exchange for their newsletters - and in the faint hope that someday, somewhere, someone may buy some of my original programs. I have over 130 of them, at only \$3 each - some of the users' groups charge their own members almost that much for public domain programs! My catalog costs a dollar, refundable on your first order, or refundable anyway if you ask. I give one-day service by 1st Cl. mail, I give bonus programs for repeat orders, I give free programs on disk orders, and I'm still not getting any orders!

I'm told that someone actually found a practical use for my number-scrambling routine, so here is an expanded version. It will scramble any sequence beginning with 1 and ending with any number less than 256 or any number greater than 256 which is evenly divisible by any number less than 256 and greater than 1, within the limits of computer memory. In Extended Basic with Memory Expansion, the limit is about 10,700; if you reformat it to Basic and run it bare bones, you might get close to 13,000.

```

GAME PROGRAMMING

 By Brian Beery

This month I will provide some techniques to add to the speed and efficiency of game programs. Note that some of the tricks described below are not just limited to use in games, but might also help in drawing programs, icon-driven software (like the Macintosh's), and many others.

One of the biggest time-wasters in game programs is the user input routine, whether from the keyboard or joysticks. Most of the time, Extended basic programmers end up trading off between less frequent input, allowing less control by the player, but more time to perform other routines, and more frequent input, which gives the player better control of his spaceship, car, or whatever, but limits the computer's response, often making the game easy.

Neither of these methods is particularly satisfying, and both, if not handled well, can produce dull games. In my opinion, the best solution is to maximize the speed of the routines you use, thus giving you more flexibility, and ultimately, a better game.

On to the methods. First

of all, the joystick routine will probably be the most executed line in most action games. Therefore, it makes good sense to make that routine as efficient as possible. Take, for instance, this code:

```

500 CALL JOYST(1,X,Y)::Y=-Y:
: X=X/4::Y=Y/4::CALL MOTION(#
1,Y,X)::GOTO 500

```

While only taking up one line, this is wasteful. First of all, unless you need to store the joystick input for later use, you may make all calculations inside the CALL MOTION. So a better answer would be as follows:

```

500 CALL JOYST(1,X,Y)::CALL
MOTION(#1,-SGN(Y),SGN(X)::G
OTO 500

```

Note that the SGN produces the same effect, in this case, as dividing by 4 would. SGN returns a 1 if positive, 0 if the number is 0, and -1 if the number is negative.

If you need to use a certain formula many times in a program, you can save memory by using a DEF statement. TI BASIC and EXTENDED BASIC have a very powerful version of the DEF statement. They can be used for mathematical functions:

```
10 DEF CUBE(X)=X^3
```

Then when CUBE(3), for example, is referred to, it will return a 27. The X, if it is in parenthesis, will have nothing to do with a variable named X elsewhere in your program.

In that lies the power of the DEF statement. You can use it to update a variable and print it in one command:

```

10 DEF XYZ=C*4^B
20 FOR C=1 TO 10::FOR A=1 TO
5 STEP .1
20 B=RND::PRINT XYZ::NEXT A
: NEXT C

```

So after being set up, XYZ can take care of itself through the rest of the program. Another use could be quick solving of mathematic-

CONTINUED

a) problems:

```
10 DEF ANSWER=A/(C+B)^A
20 INPUT A,B,C ::PRINT ANSWER
R::GOTO 20
```

But enough of these DEF statements. Keyboard input, while allowing more variety and number of controls, can be very cumbersome and difficult to handle. For instance:

```
200 CALL KEY(0,K,S)::IF S=0 THEN 1000
210 IF K=69 THEN CALL MOTION (#1,-10,0):: GOTO 1000
220 IF K=83 THEN CALL MOTION (#1,0,-10):: GOTO 1000
230 IF K=68 THEN CALL MOTION (#1,10,0):: GOTO 1000
240 IF K=88 THEN CALL MOTION (#1,0,10):: GOTO 1000
250 GOTO 1000
```

This method, while providing four directions, uses up a lot of memory and time, and does not provide for diagonals. A better way:

```
200 CALL KEY(0,K,S)::IF S=0 THEN 1000
210 X=(10*(K=87 OR K=69 OR K=62))+((-10)*(K=90 OR K=83 OR K=67))
220 Y=(10*(K=87 OR K=83 OR K=90))+((-10)*(K=82 OR K=68 OR K=67))::CALL MOTION(#1,X,Y)::GOTO 1000
```

This method allows for diagonals, and is more efficient than the first version.

If you need more accuracy than automatic sprite motion can give, and are willing to trade off execution speed for more accuracy, you should try updating the sprites yourself using CALL LOCATE. For instance:

```
100 CALL CLEAR::CALL MAGNIFY (4)::CALL SPRITE(#1,42,2,96,96)::V,H=96
200 CALL JOYST(1,X,Y)::V=V+(SGN(-Y)*(V>1 AND V<180))::H=H+(SGN(-Y)*(H>17 AND H<224))
210 CALL LOCATE(#1,V,H)::GOTO 200
```

(SGN(-Y)*(V>1 AND V<180)) checks to see what direction is desired, and then double-

checks to make sure that the move won't exceed the screen boundaries. However, once those limits are reached, no further motion in that direction or the opposite is possible. Puzzle of the month: Rewrite the formula so that you may move back after you have hit one of the limits, without using an IF - THEN construct.

The system described allows you to maintain complete accuracy as to the sprite's location.

Well, that's it for this month. Response regarding what you want to see in the column has been poor. Remember, this is your column, I just write it! Let's get any suggestions or comments in to me, so I will know what you want to hear about. Once again, my home phone # is 262-7769. Modem users can leave me email or a message on F/C/L,M.M., or the new TIBBS columbus. Anyone can just hunt me down at the meeting.

Happy Programming!

HOW TO FIX DISKS

By Miraj N. Shah
Counseled by Mike Ballman

Did you ever try to catalog a disk and find out the Disk Controller thinks the disk is NOT Initialized? But you know better! What do you usually do with the blown disk? Most people Delete the file giving them the problem. Usually that does correct the problem, but it also gets rid of that file forever. The ultimate solution is to use DISK FIXER by Navarone Industries

The DISK FIXER enables one to examine and change the contents of any disk on a sector-by-sector basis. I think it is worth its forty-dollar list price. It is available from some TI retailers INFOWARE, MICROSTUPH & ZETTLERS OR directly from Navarone Industries.

Here is the process to fix up a blown disk...

First acquire a DISK FIXER from a friend or buy one, they're worth it. Get a hard-copy catalog of the blown disk, or even better, get a complete(old) catalog of what should be on the disk. If a complete catalog is not available, try to remember what should be on the disk and write those names down on paper. Once you have a catalog of the

disk, you are ready to start using DISK FIXER

Insert the DISK FIXER cartridge and select option 2 from the Title Screen. Upon doing so you should see the DISK FIXER menu. Do the following if the most recent catalog of the disk tells you there are more sectors used/free than is logically possible: 358 for single-sided & 718 for double-sided disks

For example, IF the catalog lists 500 sectors used/free on a single-sided disk THEN do the following ELSE GOTO the paragraph on "SECTOR ONE".

This part tells you how to fix up Sector 0; which is the sector containing the information concerning the name of the disk and the number of sectors used/free on the disk. If the disk catalog tells you the used/free sector information is erroneous then Sector 0 needs to be fixed. The easiest way to this is to copy a good Sector 0 from another disk to the blown disk. Here is how to do that:

- 1) Insert a good disk in drive
- 2) Read Sector 0 of that disk:
R 0,1 <enter>
- 3) Put the blown disk in drive
- 4) Write good Sector 0 to disk:
W 0,1 <enter>

If you catalog the bad disk, you will see that the diskname and the used/free in-

formation is the same as the good disk. But do not let that alarm you. We did that to fool the Disk Controller into thinking the bad disk is at least partially restored to normalcy. Now we need to fix up the blown disk as much as we can. This is done by changing Sector 1.

Here is how to fix Sector one. First, get the most complete catalog and the most recent catalog of the bad disk in front of you. Then compare the two catalogs to see which filenames are missing. Next, compile an alphabetical list of all the filenames which are and should be in the catalog.

Then you need to find the corresponding sector for each filename. This is done by using the Find String function of the DISK FIXER

- 1) Put the bad disk in drive
- 2) Find a filename by:

F 0,2D0,1 <enter>
type in the filename
<enter>

- 3) Ignore the "ERROR N SECTOR" message
- 4) Write down the sector number for that filename
- 5) If that filename could not be found make sure you typed it ni correctly and and try again; otherwise that file does not exist on the disk.
- 6) Repeat the process from step two for all the filenames

CONTINUED

FIX CONTINUED

You should now have an alphabetical list consisting of two columns: filenames and sectors. With that information in hand you are ready to begin fixing up the bad disk. This is done by modifying Sector one of the blown disk. First you have to read Sector 1 from the bad disk by doing this:

- 1) Put the bad disk in drive
- 2) Read Sector 1 of disk by:
R 1,1 <enter>

Then you want to Alter the contents of sector one. This is done by using the Alter function of the DISK FIXER. This process is best learned by observing a concrete example Thus, lets say the blown disk has 14 files (filenames) on it. Thus there should be 14 entries on sector 1; one entry for each file. The rest of the sector should be all zeroes. Lets Alter Sector 1:

- 1) Keep the bad disk in drive
- 2) Enter the Alter function:
A 0 <enter>
- 3) Type in the following just as shown, including the spaces:
1 2 3 4 5 6 7 8 9
A B C D E
- 4) Do not press enter yet!
- 5) If you saw a non-zero entry after the "E" entry in the first column then type in a (0)

zero <space> and repeat until the first column shows a zero.

- 6) Press <enter>
- 7) Write the revised Sector 1 to the disk:
W 1,1 <enter>

You have just entered a table of pointers to the files on the disk. The table points to the corresponding sector for each file name. This is the table that is updated and sorted if you add/delete files to the disk.

Leave the DISK FIXER by typing <Q> for QUIT and press <enter>. Then catalog the disk. Lets call this new catalog the "mixed" catalog. You will see the reason once the disk has been cataloged. Notice how the catalog is NOT in alphabetical order! It does however contain all the filenames that you expected to be on the disk! The next step is to alphabetize the catalog. This is done by first alphabetizing the catalog on paper and carrying along the appropriate sector number of each filename. Here is an example of a "Mixed" Catalog.

MIXED CATALOG

FILENAME	SECTOR
CAT	1
SCREEN	5
VOTE	2
FIRE	6
APPLE	E
HELLO	9

SCROLL	C
LOAD	3
TIME	8
DEMO	7
QUICK	4
JUSTIFY	D
PLOT	B
LOGO	A

SORTED CATALOG

FILENAME	SECTOR
APPLE	E
CAT	1
DEMO	7
FIRE	6
HELLO	9
JUSTIFY	D
LOAD	3
LOGO	A
PLOT	B
QUICK	4
SCREEN	5
SCROLL	C
TIME	8
VOTE	2

The above example shows how you should alphabetize the filenames and the corresponding sector numbers on paper. Once you have done this, you are ready to enter this information into Sector 1. You do not have to enter the filenames, just the sector numbers. Here is how to do that:

- 1) Put the blown disk in drive
- 2) Read Sector 1 by:
R 1,1 <enter>
- 3) Enter the Alter function:
A 0 <enter>
- 4) Type in the sector numbers in the order as shown for the above sorted example catalog. Separate each number by a space:

```
E 1 7 6 9 D 3 A B
4 5 C 8 2
```

- 5) Then press <enter>
- 6) Write revised sector to disk:
 W 1,1 <enter>
- 7) Put a Write-Protect tab on the disk!

You have now fixed up the disk. For verification, Quit the DISK FIXER program and catalog the disk. You should encounter no problems during the cataloging process. But you are not completely done yet! DO NOT add/delete any files or programs to the disk!

Get a fresh disk and initialize it to the same configuration as the blown disk. Then backup the blown disk to the fresh disk. Then catalog the fresh disk and you will see that the used/free sector information is now correct. Thus, the fresh disk is now your working disk and the blown disk is now a disk for your archives.

Keep the blown disk in a safe place just in case you remember a file that was not previously recovered from the blown disk. Go through the above procedures to recover that new-but-old file.

If you have any questions on how to fix up blown disks please write to this newsletter in care of the Blown Disks department
Happy fixing!

END OF LINE

RANDOM SYMMETRICAL CHARACTER GENERATOR

by Jim Peterson -
Tigercub Software

This month the old Tigercub would like to share with you his methods of creating random symmetrical redefined characters. I doubt that I'm the first one who ever thought of this, but I've never seen it in anyone else's programs and I don't think it can be done in BASIC on any computer other than the TI.

In its basic form it goes like this:

```
100 DIM A$(16)
110 DATA 00,18,24,3C,42,5A,6
120 FOR J=1 TO 16
130 READ A$(J)
140 NEXT J
150 FOR L=1 TO 4
160 RANDOMIZE
170 X=INT(16*RND+1)
180 B#=B#&A$(X)
190 C#=A$(X)&C#
200 NEXT L
210 CALL CHAR(65,B#&C#)
```

Now, no one should ever use a routine without understanding it, because you won't be able to debug it and you won't be able to modify it. So, let's go through this. If you take a good look at the chart on page 109 of your "BEGINNER'S BASIC", or page II-77 of the "USERS REFERENCE GUIDE", you will see that those pairs of hexadecimal numbers in line

110 represent rows of bits which are mirror images of each other. Therefore, if we assemble a character from these pairs, it will have left-right symmetry. So, lines 100-140 read these pairs into an array. Then, lines 120-210 go

CONTINUED

through a loop four (4) times, each time picking one of these pairs at random, by randomly picking a subscript number between 1 and 16. The top half of the hex code of our redefined character is built up by adding these pairs to the end of string B\$, which starts out as a blank. For instance, if on the four (4) loops the random values generated for X are 1, 2, 3 and 4, the pairs selected are 00, 18, 24 and 3C, and B\$ is successively built up as 00, 0018, 001824, and finally 0018243C. At the same time, C\$ is built up with the same pairs in reverse order, as 00, 1800, 241800, 3C241800. Finally line 210 redefines ASCII character 65 as being string B\$&C\$, which is "0018243C3C241800", and which is symmetrical top-to-bottom as well as left-to-right.

Now that you understand how it works, let's program it a bit more efficiently.

```

100 FOR L=1 TO 4
110 RANDOMIZE
120 X$=SEG$("0018243C425A66
7E8199A5BDC3DBE7FF",INT(16*
RND+1)*2-1,2)
130 B$=B$&X$
140 C$=X$&C$
150 NEXT L
160 CALL CHAR(65,B$&C$)

```

You can cram that into one line of Extended Basic! So, what's it good for? Well, let's add:

```

90 FOR CH=40 TO 132 STEP 8
change 160 to CALL CHAR(CH,
B$&C$)
170 B$=""
180 C$=""
190 NEXT CH

```

Now we've redefined the

first character of sets 2 through 16. Don't forget lines 170 and 180. Since B\$ and C\$ are formed by adding onto themselves, they must be cancelled out before we start over or they will just keep on adding onto themselves. Next, let's give each character set a foreground color and a different background color.

```

200 FOR SET=2 TO 16
210 X=INT(15*RND+2)
220 Y=INT(15*RND+2)
230 IF Y=X THEN 220
240 CALL COLOR(SET,X,Y)
250 NEXT SET

```

Now for the fun...

```

80 CALL CLEAR
260 CALL SCREEN(5)
270 CALL HCHAR(INT(24*RND+1
),INT(32*RND+1),INT(15*RND+
1)*8+32,INT(10*RND+1))
280 CALL VCHAR(INT(24*RND+1
),INT(32*RND+1),INT(15*RND+
1)*8+32,INT(10*RND+1))
290 IF INT(10*RND)<>0 THEN
270
300 CALL CLEAR
310 GOTO 270

```

Or if you're in Extended Basic, let's change:

```

90 FOR CH=40 TO 136 STEP 4
155 SP=SP+1
160 CALL CHAR(CH,RPT$(B$&C$
,4))
165 CALL
SPRITE(#SP,CH,INT(15*RND+2)
,1,1,INT(10*RND+2)-INT(10*R
ND+2),INT(10*RND+2)-INT(10
*RND+2))
85 CALL SCREEN(5)
200 FOR D=1 TO 100
210 NEXT D
220 CALL MAGNIFY(INT(4*RND+
1))
230 GOTO 200
and delete 240-310.

```

You would prefer something a bit more useful? OK, let's try a different variation of the same principle.

CONTINUED

```

100 CALL CLEAR
110 RANDOMIZE
120 DATA TIGERCUB PRESENTS,T
HE,CHAMELEON,SCREEN BORDER,A
ND,WIPE,by Jim Peterson,
" ", " TOUCH ANY KEY"
130 M$="1800665AC342DB667E18
8100995AC3A5E78142DB24BD6600
81429924007E5AC3A5C32418
00FFDB5AFF7EFF00991881006600
18"
140 RESTORE 120
150 FOR P=1 TO 9
160 READ A$
170 PRINT TAB(15-LEN(A$)/2);A
$;" "
180 NEXT P
185 PRINT :::::
190 GOSUB 240
200 CALL KEY(0,K,ST)
210 IF ST=0 THEN 200
220 GOSUB 320
230 GOTO 140
240 CALL CHAR(128,SEG$(M$,INT(
43*RND+1)*2-1,16))
250 X=INT(15*RND+2)
260 Y=INT(15*RND+2)
270 IF Y=X THEN 260
280 CALL COLOR(13,X,Y)
290 CALL HCHAR(24,1,128,64)
300 CALL VCHAR(1,31,128,96)
310 RETURN
320 T=T+1-ABS(T=2)*2
330 ON T GOTO 340,360
340 CALL VCHAR(1,3,128,768)
350 GOTO 370
360 CALL HCHAR(1,1,128,768)
370 CALL CLEAR
380 RETURN

```

In this one, M\$ consists of any of those symmetrical pairs typed in at random, and we define a character which has only left/right symmetry by randomly pulling out any sequence of 16 of these. Another way to do this is:

```

100 CALL CLEAR :: RANDOMIZE ::
FOR L=1 TO 8 :: B$=B$&SEG$("00
18243C425A667E8199A
5BDC3DBE7FF",INT(16*RND+1)*2-1
,2):: NEXT L
110 CALL CHAR(128,B$):: B$=""
:: CALL MAGNIFY(2):: CALL SPRI
TE(#1,128,2,8,120)
120 CALL KEY(0,K,ST):: IF ST=0

```

THEN 120 ELSE 100

Now start tapping any key until you find an appropriately evil-looking alien space ship or man-eating bug for your game program.

If you consult that chart in "BEGINNER'S BASIC" again, you will find that the first eight (8) of those pairs do not turn on the first or last bit, therefore do not fill a print space. So, let us enter another program:

```

100 CALL CLEAR
110 FOR CH=129 TO 154
120 RANDOMIZE
130 FOR L=1 TO 3
140 X$=SEG$("0018243C425A667E"
,INT(8*RND+1)*2-1,2)
150 B$=B$&X$
160 C$=X$&C$
170 NEXT L
180 CALL CHAR(CH,"00"&B$&C$)
190 B$=""
200 C$=""
210 NEXT CH
220 INPUT M$
230 GOTO 220

```

Now type any of the letters with the CTRL key held down your computer has a built-in Venusian alphabet!

Many other effects and variations are possible. I use this routine frequently in my Tigercub programs. It provides the infinite variety of kaleidoscopic displays in Kaleidovision, Multivision and Ten Thousand Sights. It enables me to provide a completely different assortment of colorful cards to turn over in each new game of Match a Patch, and a new screenfull of walls in each game of Getaway. It provides the colorful characters of the Mongolian Typewriter for the little tots, and the rainbow displays that reward correct answers in Kinderminus, and many more.

END OF LINE

LETTER TO THE MEMBERS

Dear Members,

In reading the newsletters from other User Groups, we all have a common problem -- the same people are writing articles for their newsletters each month and the editor keeps asking for new people to participate. I admit I was just as bad, if not worse, as the rest of you. I always thought that no one would be interested in what I had to say and my knowledge on the computer is so close to zero that I could not write an original program that would win any award. Well I'm writing this on behalf of all the officers to encourage every member to write something. It can be about a problem you are having or some story about your family and the TI -- I'm sure everyone has those.

If you're like me I never got anything written up and given to any of the officers by press time. Well here's a suggestion--write something up or put it on tape using REM statements (the tape will be returned to you) and bring it with you to the next meeting. That way it can go in the following newsletter. Most things aren't outdated from one month to another and if everyone, myself included, helps a little it will add up to a lot.

See you at the next meeting.

KING OF THE CASTLE

You are a Norman king asleep in your castle. Suddenly you are awakened by the horns of viking invaders...

Sound like the start of something fun? Well, it is! King of the Castle is no ordinary game. Not only is this an excellent game story line, but it's faster than you would ever believe. I don't mean quick, I mean fast! How, you ask? King of the Castle is written in TI9900 Assembly Code, which runs much faster than any TI Basic or TI Extended Basic program.

Your group has purchased a license agreement from Cyndex Software and will be distributing the program and its files to its members this month. Want to know more about this great game? Come to the September meeting, where we will be demonstrating it. It will be available after the meeting on cassette for \$3.00 or we will put it on your disk for \$2.00 so be sure to bring a blank unformatted disk with you.

One last note: it will not run on a bare system, you will need any of the below configurations.

- 1) cassette recorder, Mini Memory, joysticks
- 2) disk drive, Mini Memory, joysticks
- 3) disk drive, 32K memory, Editor Assembler, joysticks
- 4) disk drive, 32K memory, Extended Basic, joysticks

FORTH SINGLE-DRIVE DISK COPIER

EQUIPMENT NEEDED: CONSOLE, 1 DISK DRIVE, EDITOR-ASSEMBLER, BACK-UP COPY OF TI-FORTH

This program will allow you to make back-up copies of most disks in 6 passes. This is a lot faster than the 18 passes using the earlier copying information where you had to type in 0 1 2 3 4 CD CD CD CD CD etc. Everything is screen prompted for ease in using. The original program is from St. Louis 86 with revisions by Bill Knecht. The auto-load is by Larry Pipkin & Bill Knecht.

This program will have to be typed in on an extra copy of your original FORTH Systems Disk and used by itself, i.e., don't put any other screens on this disk. After you have made your back-up copy, follow these directions.

LOAD FORTH PROGRAM - Ed/Asm option 3 Load & Run DSK1.FORTH

Load EDITOR. Type 4 EDIT (Enter) 4) should be blank. Type in SCR #41 then hit FCTM 9 (Back) to get the cursor below the screen. Type FLUSH and hit ENTER. The information is now saved on screen 4).

```
SCR #41
0 ( half-fast one-drive disk copier -- C. Schram 4/28/84 )
1 ( COLD load this screen and DUPLICATE )
2 BASE->R DECIMAL -SYNONYMS 0 VARIABLE BIG 15358 ALLOT
3 : ?# EMPTY-BUFFERS 0 BLOCK 10 + @ 256 1024 */MOD SWAP 0= 0= + ;
4 : PAK CR ." PRESS ANY KEY " S2 6PLLNK KEY DROP CR CR ;
5 : LMD ." LOAD MASTER DISK" PAK ; : LCD ." LOAD COPY DISK" PAK ;
6 : DUPLICATE CLS 0 0 GOTOXY LMD 0 DISK_LO ' ?# DUF DUF
7 DISK_SIZE ' DISK_HI ' LCD
8 ." ... FORMATTING COPY DISK ..." 0 FORMAT-DISK
9 0 DO CLS 0 0 GOTOXY LMD
10 1 15 0 DO DUF I + DUF . CR BLOCK BIG I 1024 * + 1024 CMOVE LOOP
11 CLS 0 0 GOTOXY LCD
12 15 0 DO DUF I + DUF . CR BLOCK BIG I 1024 * + SWAP 1024 CMOVE
13 UPDATE FLUSH LOOP
14 DROP 15 +LOOP 1 DISK_LO ' : R->BASE
15
```

After you have entered and flushed screen 4), type in 3 EDIT (Enter) and make the following changes:

```
SCR #3
0 ( WELCOME SCREEN ) BASE->R HEX 10 SYSTEM ( Clear Screen )
1 0 0 GOTOXY ." Loading Forth Copier " CR 10 83C2 C' ( Quit off)

12 4) LOAD
13 CR CR CR ." READY...TYPE 'DUPLICATE' " CR CR CR CR
```

FLUSH This screen as you did with screen 4). Next type in 20 EDIT and Erase lines 9-15. Then add the following

```
9
10
11
12 (12 spaces) FORTH SINGLE-DRIVE
13 DISK COPIER
14
15 one moment please
```

FLUSH this screen and your program is now complete. Take the disk out and attach a "Write-protect tab". Put the disk back in the drive and enter COLD. Follow the prompts and enter NO when finished or COLD to copy another disk. This program runs automatically by loading DSK1.FORTH.

This article comes to us from HUG, The Houston Users Group, Sept.

CURSOR DEFINITION

by Tony Johnson

It seems that every computer that you look at has a different type of cursor. Some have a blinking square, such as the 4A, some have a "_" sign, still others have, and my personal favorite, an " ". So, why can't the 4A have one?

After a few tries, I came upon it. First you need the following equipments: 1) Disk drive, 2) Extended Basic, 3) Expansion memory, 4) Editor/Assembler. You can get by without the E/A if you have a friend with one or can get the object code from someone who has the program. Then you need to do the following steps.

Step 1. Get into your E/A and enter the following program:

```
DEF CURSOR, VMBW

VMBW EDU >2024

NEWDEF DATA >0000, >0000, >0000, >7E00

CURSOR LI R0, 1008
LI R1, NEWDEF
LI RS, 8
BLWF @VMBW
RT
END
```

The data statement holds the hexadecimal code for the cursor. After entering it into the E/A, save the file in "DSK1.CURSOR1". Next, assemble it using the "R" option storing the object file in "DSK1.CURSOR". Below is source listing of the above program:

```
0001A A0000B0000B0000B0000B7E00B0200BB03F0B0201C0000B02027F375F 0001
A0012B0000B0420B2024B045B7FASCF 0002
50000BCURSOR62024VMBW 7FA74F 0003
: 99/4 AS 0004
```

Step 2. Leave E/A and get into X-basic. Then type in the following program:

```
100 CALL CLEAR
110 CALL INIT
120 CALL LOAD("DSK1.CURSOR")
130 CALL LINK("CURSOR")
140 END
```

For those who aren't too familiar with these commands, the "CALL INIT" will prepare the expansion memory to load and run assembly program, the "CALL LOAD" statement will load the file after DSK1 into the expansion memory and "CALL LINK" will transfer control to the assembly language program. When the program finishes with the loading and linking of the program, control will be passed back to you, and you should have a blinking "_". Save the X-basic program under "DSK1.LOAD" so that every time you enter X-basic the cursor will come up as an "_". Also, the assembly program will stay in the expansion memory until you turn the power off or if you use a program such as TI-WRITER or E/A that will write over that memory location. When you come back to extended basic, just type in 'CALL LINK("CURSOR")' and the cursor will come back up.

YOU WERE A KID ONCE TOO!
HAPPY HALLOWEEN

Are you tired of squabbling with your spouse or lover over what six numbers to choose for the Ohio Lottery every week? Why not let your T.I. 99/4A eliminate the headaches. The snort program that follows will randomly choose six numbers between 1 and 40 for you. If you want more than one set of numbers (of course you will!), simply press the space bar when prompted. Pressing any other key when prompted will terminate the program. Note that lines 280-300 assure that the random number seed generated by the computer will be different each time the program is used. This technique is good to use in any program where random numbers are desired. Since the amount of response time to the prompt will differ between each use, the random number seed will always be different. After all, you wouldn't want to have to share your \$24+ million (or whatever the jackpot may be) with other club members would you?
