Mail Address: 1296 LINCOLN Ave. Apt. B Ogden Utah 84404
 GROUP OFFICERS

Vice President: JimBuck 773-2532
 Secretary-Treasurer: Harold Bingham 394-6382
 Librarian: Harold Hilburn 773-0622
 Asst. Librarian: Mel Brogg 393-9605
 Newsletter Editor: Mel Brogg 393-9605
 Associate Editor: Harold Hilburn 773-0622

FEBRUARY 1990 NEWSLETTER FOUR NEXT MEETINGS ARE:

SATURDAY: FEBRUARY 03 TIME: 0900 hrs.
 SUNDAY: FEBRUARY 04 TIME: 1000 hrs.
 TUESDAY: FEBRUARY 20 TIME: 1900 hrs.
 We will be meeting in the CIVIL AIR PATROL building at the OGDEN MUNICIPAL AIRPORT AIRPORT ROAD. On the corner.

We have started a BASIC class for those interested. The people taking the BASIC class will meet on the FIRST and THIRD Tuesday of the Month at times above. Jim Buck is the teacher. These meetings are held at the Hill Side Center in the basement. ROY CITY CENTER.

THE CLUB THAT REFUSES TO SAY GOODBYE

IN FEBRUARY 1990

HAPPY VALENTINE

STOP PRESS NOTE ADDED TO THE FOLLOWING ARTICLE:

We have just received a letter dated Dec 29/89 from Tony McGovern in response to a letter we sent him about a few days in the initial release of Funnelweb v4.2. Tony says "You are right, don't circulate widely on 4.20 until 4.21 is received...I'll send 4.21 very soon." It was initially our intention to include disk with FWB v4.2 to all exchange user groups and out of town paid readers who receive this newsletter. We will now wait on this. When v4.21 is received, we will mail it. The major bug in the current v4.2 is that you cannot run BASIC software from the 28 user list. You are instead returned to 28 command mode. This really is no problem, because you can run 28 software from the DISK REVIEW part of Funnelweb. These user groups and out of town readers who are super anxious to get their hands on v4.20 as it now exists can do so by sending TWO DISKS and a paid return ailer. We will send out v4.21 when it is available.

FUNNELWEB VERSION 4.2, IN 40 AND 80 COLUMNS
New Features Report by Charles Good
Lisa Ohio User Group

Dated Nov 14, the first release of Funnelweb v4.2 has been sent by Tony McGovern to his regular correspondents and to those who recently sent him a fairway donation. Originally, Tony was planning to completely rewrite an 80 column version of FUNNELWEB from scratch, adding its coding more "relaxed" and compact and giving it the new name of "HITLERBOS". However, such a rewrite would have made HITLERBOS directly incompatible with previous versions of FUNNELWEB with respect to previously created user lists and system configuration (SSPCON) data. So Tony has put HITLERBOS on hold and has incorporated some of the new features he planned for HITLERBOS into the latest FUNNELWEB.

DISK REVIEW

The enhanced disk directory available to 80 column users (General, APC card, or Macintoshes 80 column peripheral) since last summer as the GDMV has been renamed DISK REVIEW. It comes preconfigured in one of the FWB central menus and now comes in both 80 and 40 column versions. Yes, now 40 column users can take use of this new VERY POWERFUL utility. With the 40 or 80 column DISK REVIEW you can bring up a disk directory and move the cursor next to a file name. You can then press "q" and run the software. This includes assembly language software that reads as PROGRAM or D900 on the disk (double played in) that reads as PROGRAM or D900 on the disk software. The only thing you can't run this way is II BASIC using the speech.

Using either 40 or 80 column DISK REVIEW, you can protect, unprotect, delete, rename, and copy (a feature not previously found in GDMV) the disk directory file next to the cursor. File copy requires more than one drive. You can examine the contents of the disk header sector (sector 0), and you can examine each of the file header sectors. You can print a disk directory to a printer, or to a D900 disk file name. When printing to a disk file, the file is opened in APPEND mode. This allows you to chain successive disk directories into one large text file which can serve as a reference data base to quickly show you the contents of your entire disk library. These features allow you to use DISK REVIEW for any of the things you would usually have to do from a disk manager.

With the 40 column DISK REVIEW you can load ANY KIND OF FILE into a ITC buffer for viewing on the screen. If the file fills the buffer, the file continues to load and overwrites the contents at the beginning of the buffer. You can load the whole file in at once, or page it in one screen at a time, or one file record at a time. PROGRAM files loaded this way are displayed simultaneously in both ASCII and Hex. The display resembles what you see with a sector editor. The most useful use of this VIEW feature of DISK REVIEW is the viewing of D900 text files. You can take without having to make a hardcopy. Then you can go back to the DISK REVIEW disk directory and Rival the software. The ITC buffer will accommodate about 48 disk sectors of text before it starts to overwrite itself. Once in memory, you can print the file to a printer in whole or in part. You can also print the buffer text in two places and print to printer or disk file only that part of the buffer contents between the marks. This allows you to enter a small D900 file containing only part of the text of a larger D900 file.

With the 80 column version of DISK REVIEW there are two 8K VIEW buffers, the second available only if you have 192K of video RAM installed. This is an easy option with the APC card. It can be done, but not easily, on a Geneva. You can put text in each of these buffers and display either buffer on the screen, alternating back and forth between either buffer and the disk directory. You can also display both buffers simultaneously, scrolling them both up and down and printing all or parts of either buffer. Text in each buffer stays in memory for instant recall without disk activity until you exit DISK REVIEW. The 40 column DISK REVIEW has only one text buffer.

REVISED EDITOR

The text and assembly programs 40 and 80 column editors have been rewritten internally to allow each faster move

MARKY MARK

lines, copy lines, delete lines, and reformat. MOVE LINES no longer causes a TEXT BUFFER FULL condition. Because of the increased speed of reformat, it is now unlikely that characters will be dropped at the end of lines using the 40 column editor, slightly more likely with the 80 column editor. Text buffer capacity has been increased slightly. When editing, you can alternate back and forth between the different sets of tabs using ST (swap tabs). T displays the current set of tabs. ST displays the alternate set. Both sets of tabs are saved on disk when the file is saved with ST. In the 80 column editor the tabs can optionally be displayed on the bottom editor.

A new feature has been added to the assembly source code editor (the EA editor) that is useful for creating new assembly code, or typing in an assembly listing from a newsletter or Microstation. You can, optionally, keep the alpha left off and type everything in using lower case, using SHIFT for upper case as desired in the constant portion of each line of code. When you press (enter) after typing a line of code and its comment the code automatically becomes upper case letters as is required for source code, while the comment remains just as you typed it in a mixture of upper and lower case. This saves comments such as easier to read and to distinguish from the actual source code when viewing a source code listing.

In the 80 column ShowDirectory, you can bring up a second directory without having to exit SD to the editor and then reedit SD. In the 40 column SD you still have to back out and then reedit SD to see another directory.

PATH NAME CONFIGURATION FOR HARD DRIVES ETC.

When configuring FWB v4.2 you have the option of designating a path name for all files. When set, path name configuration deactivates boot disk tracking and whatever drive numbers you choose to designate for the IIWriter and EA central menus. Path name choices are D51, FWB, or RD, or D52L, or HD. If you choose this option, if you are using a hard disk D51, FWB, allows you to have all the Funnelweb files, including user configured software, as files in the same subdirectory. This leaves D52L, equalization available for other purposes. Using RD, you can put all your Funnelweb files on a hard disk. I think D52L, works with a Funnelweb card. Once boot path is set, the rest of the configuration process just needs file names. Funnelweb will automatically insert the boot path name in front of the file name when searching for the file.

ON THE FLY RECONFIGURATION

When editing Funnelweb from either of the central menus you press FCM/7 (MCKI). You need to know this, since there is no screen prompt to suggest that FCM/7 does anything here. If you answer "Y" to the resulting DIT? prompt you are then given the opportunity to temporarily load a different character set into memory. Change the editor printer default name, and change the II Writer and EA central

some drive numbers. These changes are not permanently read back to disk but they do remain in effect until you exit Funnelweb.

OTHER SMALL CHANGES

Files in all disk directories are no longer sorted by pressing a number. Instead you move the cursor next to the file name with the arrow keys (E) or FCM/KEY) to perform some action on that file. It is only really necessary to sort a file with search bar or "q" or (enter) depending on where you are within Funnelweb) if you want a D900 or D900 file to be the writable name that appears in the editor when you LF or ST.

You can now protect and unprotect with QUICK DIRECTORY, which you can access from most places in Funnelweb with FCM/7 (MCKI).

When booting D900 software from the CONDENS menu, or with RIVAL from DISK REVIEW and you have put all the files into memory, you have to dial the next D900 prompt off the screen with spaces or with ESCAPE before you press (enter) in order to display the START name. If you press (enter) without doing this you get an error. You can recover from this error with REGO. Then press BRNSE and then (enter) to display the START name.

The FFORMAT is now an independent LEADER 82 file not linked directly to the rest of the Funnelweb environment. This means you can use other formatters, such as the one that comes with Art Green's "Tinkerweb" v4.2. Instead of the formatter that comes with Funnelweb. Rename the alternate formatter files RD, FF, etc and put them on the Funnelweb disk or subdirectory.

Screen layouts for the 80 column DISK REVIEW and SHOW DIRECTORY have been improved, compared previous versions of 80 column Funnelweb.

You can no longer delete files from the EDITOR (using line), although the prompts on the FILES submenu on the command line say that you can. File deletion is now done from within the EDITOR using SHOW DIRECTORY.

CONCLUSIONS

New features are found throughout the new Funnelwebs. 40 column users especially will love the new very powerful features available to them in DISK REVIEW. DISK REVIEW is a major new piece of software, not just a minor update. If you use it you should send Tony an additional fairway payment over and above what you have already paid for other parts of Funnelweb. How much additional? Well, DISK REVIEW is comparable to the latest versions of John Johnson's 8001, maybe better. You can consult 285 in recent MICROPSYCHOLOGY for the asking price of 8001.

8330MERS

JEFFING TIW

IMPACT/99X
BY JACK SUGHRUE

If you still have an arrived, jargonist, when such a title as JEFFING TIW has been assigned?

• FUMBLEHEAD, you say have become familiar with the include file structure. This include-filing process (known as JEFFING) allows some extraordinary things to happen to your word processor. It automatically strings up a file into your text that will let you access, stably, some very complex things.

Like what?

• Like that, for example, but let's say you'd like to have a ten-page style format (centered heading, right justification, wide margins, double spacing, along with an active transposition key to underline, double strike, under/over script, and so on) at will WITHIN YOUR DOCUMENT AND GENERATED FROM KEY PRESSSES, then JEFFING will give it to you. Then lets say that part say through this term paper you need a large indentation and condensed type to offset that aspect from the rest of the paper, and then go back to the original structure. JEFFING does that by just adding a few characters before the offset piece and a few characters to return it, right in the text as you are typing.

• If you have a series of sections in a long piece of writing, a novel perhaps, you have six chapter written, you want to load up the first and print all six chapters saved under different filenames. With the flick of an JEFFING switch you can create the ALL while you're off having dinner or taking your dog to the cheese factory. When you return your novel (to this stage) is printed out. That's JEFFING.

First, you must build a file to be JEFFED. Much easier thing in the world. We'll discuss the other eight in another column some time, but I will mention that breathing is Number One. So you can see the competition.)

- JEFFING FROM 75:IN 5
- TL 15:27:52
- TL 2:27:53
- TL 3:27:53.9
- TL 4:27:53.1
- TL 5:27:54
- TL 6:27:54.3
- TL 7:18
- TL 8:27:57.1
- TL 9:27:57.0
- TL 10:27:56.3
- TL 20:18
- TL 12:7
- TL 21:27:45.1
- TL 22:27:45.0
- TL 15:27:21
- TL 16:27:22
- TL 17:27:21.89
- TL 18:27:20

Above, for example, is a code translator I use in the PDS2 companion disk I wrote and edited for the Fairware server. As translate codes go it is fairly simple. The first line fills 30 words (for right justification), left margins (in 4), right margins (in 3), and inserts 15 in from any left margin (established during my document). This, I would assume, would be a reasonable standard for most text. I could have added (and did on other translators) double spacing, automatic page numbering, a pre-designed header, or any other things. The translate above is primarily to activate the TL key. After this translate is SHED as a file (do not type in the > sign). Begin each line with the period. It is best to keep that they file on your main FUMBLEHEAD (or whatever) disk under a quick title. I refer to it as CS because it is the third translate I created. CS, for example, will automatically let me type out in condensed at 122 columns wide with all the TL keys intact. CS will give me the term-paper structure I mentioned above. CS is

strict TL. My margins and indents will be my own problem, and so on.

Okay, let's say you've typed in and SHED that exact file under the filename CS on your FUMBLEHEAD on DSX1.

Now, whenever you load your word-processor and the cursor starts your initial command, type T (ENTER). Then put in L on 1, and J on 5, and so on as J. This will set your screen margins within the width of the screen and will automatically create an indentation at the start of each paragraph. You'll be able to read everything on your screen - no more wandering.

Next, press CTRL/O. This will rid the screen of line numbers and let you view your literary masterpiece in full.

Now your cursor is sitting in the upper left corner of your screen cursor to go. Type the following without the parentheses: (JF DSX1,CS) and press ENTER.

Type whatever text you want, viewing it perfectly on your screen. Feel free to use the TL keys to underline, enlarge, condense, doublestrike, superscript, italicize, letter quality, align, whatever, whenever you wish. The code is sitting there to automatically FORMAT this text into the original fill/justify etc. you wanted. And, even though the translate is there, you have the most extraordinary other things built in.

The TL chart is automatic. I built it that way when I first began to use the TL key in 1981 to help myself remember. It has been very easy, very faithful.

With that CS sitting in DSX1, all you do to automatically call up any of this stuff is type the following: CTRL/O, SHIFT/A, CTRL/O, A is the letter that turns on the desired printer code. The following ALPHABETICAL letter, using the same CTRL/O, CTRL/O, CTRL/O will turn off the code.

An example would be if you wanted some words doublestrike for emphasis. You would type along regularly. Then when you came to the word or words you wanted doublestrike you would type CTRL/O, SHIFT/O, CTRL/O. Then type all the things you want in that type. Then type CTRL/O, SHIFT/O, CTRL/O. That will shut it off, and you can go on typing to your heart's content. If O turns it on, P turns it off. Italic is turned on by A, so B turns it off. Underlined is turned on by U, so V turns it off. If you wanted some words underlined and doublestrike and in italics with the above template, you would type CTRL/O, SHIFT/O/A, CTRL/O. To turn this batch off type CTRL/O, SHIFT/O/B, CTRL/O.

Next, oh?

(At the end of this article is the complete mnemonic code Quick Reference Chart for the FUMBLEHEAD Translate CS shown above.)

The TL key, by the way, can do MUCH, MUCH more than just activate printer codes in this way. But that will have to be another column.)

Now back to our text. You've type all you wanted (let's say a two-page letter) and you're ready to print. Type S. Type PDS2, whatever. After the file is SHED to another disk, go back to the command line (CTRL/Y) and type 3 (ENTER) and E (ENTER). If you are using FUMBLEHEAD you are back to the same. Type 2 (FORMATTER). When the file comes up it'll say DSX2, whatever. Turn on your printer. Press the key all the way down (and watch your printer PRINT out full-width, right-justified, fully-coded text).

But what if you wanted to print lots of files? There are lots of ways of doing this. Whatever is convenient for you.

I took the CS translate above and added the following for a special project

- JEFF PAGE 1
- JEFF DSX2,THE/LINK1
- JEFF DSX2,THE/LINK2
- JEFF DSX2,THE/LINK3
- JEFF DSX2,THE/LINK4

This translated out each file of my book after first going back to DSX1,CS to see what was expected of the FORMATTER. But it would go to DSX2 to get each file itself.

I could even add

- JEFF DSX1,THE/LINK5
- JEFF DSX1,THE/LINK6
- JEFF DSX1,THE/LINK7
- JEFF DSX1,THE/LINK8

If I wanted to, because the original JEFF will sort it all out for me. If one file is on DSX3 and another on DSX1 and another is any drive as long as the disk name is BOOK, it will find the file and PRINT it out.

Isn't that extraordinary?

If you find you can expand the horizon of your THINKING for whatever IBM processor you're using to exciting new directions, I have used the [if] to much over the years. I have even created UP translators that make the Coding even easier. I have a file called 2, for example, that automatically loads up the C code and the first few lines including condensed COMBAT codes which can't be replicated in this article. But you could actually create the following file and call it 3 because it will drive up C3 in the automatic process:
IF DSK1,C3

GC 1
F0MPLUS' 1, 4, 4
.....
By Jack Sogrove

This automatically loads the IF and Centers the next four lines which act as a quick heading for letters about Version 1.4. From there I can type the notes or comments or letters or article and SAVE it by its own name. When I print it out, it will call up C3 and PRINT out all my text within the C3 structure. This is great because you are automatically at the Command Code when you enter F0MPLUS. Just typing DSK1,; loads up everything shown above and the C3 I had previously set. Just, no more typing no more typing the IF into, no more setting up the test structure. It's all in one easier - 2; and all the programming code is in C3, beautiful.

I don't know of another word processor that allows such wonderful flexibility and speed.

This section of translators would be even greater with RAMBASE and DSK00 drivers, but all my systems had when I first created and used these codes was one SSSD driver, and it sure is easy and fun.

Jack Sogrove, Box 459, E. Douglas MA 01518

If any newsletter editor prints these IMPACT/99 articles, please put
me on your mailing list. Thanks - JS

```
DOCUMENTATION FOR CASSETTE LIBRARY UTILITY (VERSION 1.0 (1))
CREATED BY MART MASSENA OF THE WESTERN NY SYSTEMS
MODIFIED (V.2.0) BY RICKY SCOTT OF THE WEST PEAR 99/05
.....
PROGRAM NAME: CASLIB01 (SEE LIBRARY)
PROGRAM DMS: CASLIB01 (DOCUMENTATION)
PROGRAM FILES: ASCIIFILES AND ASCIIFILE2 (ASCII SET-UP)
.....
THIS BITTERED BASIC PROGRAM WILL ALLOW YOU TO PRINT OUT A
NEAT LITTLE INSERT FOR YOUR CASSETTE TAPES, JUST LIKE THE
ONES THAT COME WITH THEM.
ALL PRINTER CODES ARE EPSON COMPATIBLE. YOU MAY WISH TO
MODIFY PROGRAM LINE 570 TO OPEN YOUR PARTICULAR PRINTER.
CURRENTLY THIS PROGRAM OPENS THE FOLLOWING PRINTER DEVICE:
(LS32022;NAME:IBM-3500).
.....
WHEN YOU FIRST BOOT UP THE PROGRAM, YOU WILL BE ASKED IF YOU
WANT TO USE FILES OR INPUT THE INFORMATION DIRECTLY. (MORE
ON THIS LATER. YOU WILL THEN BE ASKED FOR YOUR FILE NAME,
FOR 6000 REASON, THAT LITTLE TAB OVER THE OTHER SIDE OF
YOUR TAPE WILL BE PUT TO GOOD USE BY STATING ONE THE TAPE
BELONGS TO. (THE DEFAULT SPACE LIMIT IS 28 CHARACTERS).
NEXT YOU WILL BE ASKED IF YOU WANT ONE OR BOTH SIDES OF
THE TAPE INDEXED. (THE DEFAULT IS 2 FOR BOTH SIDES).
.....
YOU WILL THEN BE ASKED FOR THE CASSETTE TITLE (THE DEFAULT
SPACE LIMIT IS 25 CHARACTERS), AND AN SPECIFIC IDENTIFICATION
THAT YOU MAY WISH TO RECORD. (AGAIN, THE DEFAULT SPACE
LIMIT IS 25 CHARACTERS).
.....
FINALLY, YOU WILL BE ABLE TO INPUT YOUR CASSETTE PROGRAMS,
USING ANY CODING SYSTEM YOU MAY PREFER. (THE DEFAULT SPACE
LIMIT IS 27 CHARACTERS).
.....
SHOULD YOU MAKE A MISTAKE WHILE ENTERING YOUR PROGRAM DATA
JUST WITH THE (ENTER KEY) AT A BLACK LINE AND YOU WILL THEN
BE PROMPTED BACK TO YOUR PREVIOUS ENTRY.
.....
WHEN YOU HAVE COMPLETED ALL OF YOUR PROGRAM DATA INPUTS,
JUST TYPE (0) AND HIT THE (ENTER KEY). (NOTE: THE (0)
WILL NOT APPEAR ON YOUR PRINTED INSERT).
.....
LAST, YOU WILL BE ASKED IF YOU WOULD LIKE TO FILE OR PRINT
YOUR INPUTS. (THIS SPECIAL FEATURE WAS INCLUDED BY MART
SO THAT PEOPLE WITHOUT PRINTERS COULD FILE THE INFORMATION
TILL THEY COULD HANGON A PRINTER ON COM A FRIEND INTO
PRINTING THE INSERTS).
```

NOTE: IF YOU HAVE FILED INFORMATION STORED ON YOUR DISK
YOU COULD JUST TYPE (F) AT THE FIRST PROMPT, WHICH WOULD
PROMPT YOU FOR THE FILENAME YOU WANT YOUR DATA STORED
UNDER. (ONCE YOU HAVE ENTERED YOUR FILENAME, JUST HIT BACK
AND WATCH YOUR PRINTER GO INTO ACTION. (PROVIDED YOU DID
REMEMBER TO TURN YOUR PRINTER ON).

YOU MAY ALSO MAKE MULTIPLE COPIES BY SIMPLY REPRINTING.
THE "PRINTERS" ARE JUST FOR FUN, AND YOU WILL HAVE TO HOLD
YOUR KEY PRESSER LONGER BECAUSE OF THEM.

SPRIT OF 99

SPRIT OF 99

TWO JOYSTICKS IN ONE.....BY Curtis Borders.....C.O.N.N.I.E.

This is how I made two joysticks out of one:
First you will need one of those surplus joystick cables. All the pins will have to be there with the exception of pin 1 and 6. (Pins 1 and 6 are not used on the TI 99/4A.) You can get one at "Star Surplus" on N. High St. Columbus, Oh. They sell for about \$1.99. OK, now that we have the cable, take your favorite joystick-- it can be Atari, Boss, EPSON, or Mico, but I wouldn't waste my claim on TI joysticks. Take the joystick apart and unsolder the cable from the connectors, all but the ground (or common) wire. That's the wire that connects all the pads together.
Take your new cable and an ohm meter and write down all the pin numbers and what color wire it is, because all color codes may not be the same. Take the _____ color wire from pin 2 to one of the outside terminals of the switch, then take the _____ color wire from pin 7 to the other side of the switch.
Take a short piece of wire from the center of the switch and solder it to the ground (common) wire. If the switch is wired up right, when it is in one position, you will be using joystick number 1, and when it is in the other position, you will be using joystick number 2.
Take the _____ color wire from pin 3 to the joystick up position.
Take the _____ color wire from pin 8 to the joystick down position.
Take the _____ color wire from pin 9 to the joystick right position.
Take the _____ color wire from pin 5 to the joystick left position.
Take the _____ color wire from pin 4 to the joystick fire button. The other side of the fire button will go to the ground (or common) wire.
Use schematic below.

TALKING TYPEWRITER

From the June issue of MICROPENDIUM COMES THIS VERY USEFUL PROGRAM FOR THE VERY YOUNG IN THE FAMILY OR IN THE SCHOOL TO HELP THEM LEARN THE ALPHABET.

EXTENDED BASIC VERSION DISPLAYS A KEY DEPRESSED IN DOUBLE-SIZED IMAGE IN THE CENTER OF THE SCREEN AND SAYS THE LETTER.

100 REM TALKING TYPEWRITER, E
110 EXTENDED BASIC REQUIRED
120 CALL CLEAR
130 CALL KEY(O, K, S)
140 IF S=0 THEN 120
150 IF K=90 THEN 120
160 IF K=85 THEN 120

161 CALL CLEAR
162 CALL SPRITE(4, 1, 2, 85, 120)
164 CALL MAGNETY(2)
170 CALL SAY(CHAR(K))
180 GOTO 120

If you wish to use a TE-II cartridge instead of extended basic, then remove lines 162, 164, and 170 and insert:
165 CALL HCHAR(12, 14, K)
166 OPEN #1: "SPEECH". OUTPUT
170 PRINT #1: CHR(10)

EXTENDED BASIC GROM/ROM PARTS..... THIS INFO IS RIGHT OFF THE INVOICE I RECEIVED WITH THE PARTS FROM TI DEALER PARTS:

PART NUMBER	DESCRIPTION	QUANTITY	UNIT-PRICE
1015960-1113	GROM EXT. BASIC	1	3.60

 TAX PLUS 3.00 FOR 5/H.

INTERNAL BOARD
(ZENO BOARD)

THE INTENT HERE IS TO HELP THOSE OF YOU IN THE WEST PENN 99'ERS AS WELL AS ANY IN THE USER GROUP COMMUNITY TO GET STARTED IN THE CONSTRUCTION AND INSTALLATION OF THE BOARD. I WILL TRY TO ADDRESS SOME OF THE PITFALLS AND GIVE SOME HINTS THAT MAY BE HELPFUL. I HOPE THAT YOU REALIZE THAT EVEN THOUGH ERIC ZENO HAS MADE THIS BOARD IN DESIGN FOR ABOUT A YEAR NOW, HE LIKE MOST OF US IS DOING THIS FOR YOUR BENEFIT, AND WILL NOT QUIT OUR JOBS TO MAKE A LIVING ON IT USERS.

FIRST, THE BOARD DOES HAVE ONE ERROR IN THE TRACE LAYOUT, AND THAT IS THE DATA BUS ON THE CLOCK CHIP U12. MOST OF YOU WILL NEVER USE THIS CIRCUIT, AND THOSE OF YOU THAT DO, SHOULD BE ABLE TO INSTALL THE SIMPLE INVERSION OF THE EIGHT DATA LINES, I.E.: REVERSE THE PINS 15 THROUGH 22 UNDER THAT CHIP. I FEEL THAT THIS SHOULD STOP NO ONE FROM BUYING AND USING THE BOARD.

SECONDLY, THE TRACES ARE SMALL AND TIGHT IN AREAS THAT WILL GIVE A NOVICE FITS. DON'T BUILD IT YOURSELF IF IT LOOKS TO TIGHT FOR YOU AND YOUR EQUIPMENT.

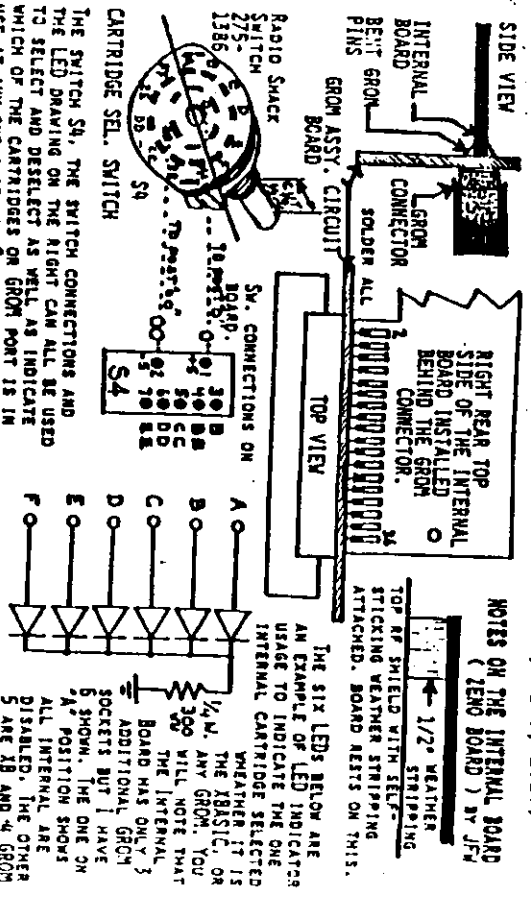

THIRDLY, THE INITIAL INSTRUCTIONS ARE BRIEF, AND INADEQUATE FOR MOST OF YOU, THAT IS WHY I'M INCLUDING THESE TWO PAGES IN THE NEWSLETTER. YOU NEED HELP NOW! I HAVE BUILT TWO AND SINCE I DID THEM WITHOUT INSTRUCTIONS, I FEEL THAT YOU SHOULD DO MUCH BETTER WITH A LITTLE HELP.

DECIDE WHAT PORTION YOU WISH TO BUILD FIRST. ATTEMPT AND GET ONE CIRCUIT WORKING AT A TIME. DO NOT FULLY SOCKET THE ENTIRE BOARD. SOCKET ONLY THE CIRCUIT YOU WILL NEED FIRST, SUCH AS THE 32K CIRCUIT. MAKE UP THE HARNES FROM P2 TO THE CPU BOARD, SOLDER THE BOARD TO THE GROM CONNECTOR (SEE PAGE 6), AND BEFORE YOU PLUG IN P2 POWER UP THE CPU. IF ALL SEEMS WELL, THEN PLUG IN P2, THEN PLUG IN THE 32K MEMORY CHIP (FOR EXAMPLE). IF ALL IS STILL WELL, THEN RUN A MEMORY TEST BY LOADING A PROGRAM THAT USES EXPANSION MEMORY OR A RUNNING A MEMORY DIAGNOSTIC. IF A STEP FAILS, DON'T GO ON, BUT GO BACK AND CHECK FOR A SHORT OR CHECK TO SEE IF P2 HARNES IS WIRED CORRECTLY.

HERE IS ANOTHER AREA OF CONFUSION. THE P2 CHART ON P. 7 OF ERIC'S INSTRUCTIONS DOESN'T ADHERE TO THE PIN PHOTO-COL FOR THE CONNECTOR, THEREFORE USE THE CHART AT THE RIGHT, AND ON THE ASSEMBLY DRAWING ON P. 9 OF INSTRUCTIONS CHANGE THE PIN NUMBERING SCHEM TO THAT SHOWN AT THE RIGHT ALSO. THIS WILL PROVIDE YOU WITH A MEANS TO ASSEMBLE A 16-WIRE HARNES WITH A 16-PIN RIBBON CABLE CONNECTOR TO MATE WITH A 16-PIN DOUBLE ROW HEADER AND HAVE EVERYTHING COME OUT SO THAT THE WIRES ARE IN ORDER AND EASY TO COUNT AND MATCH CONVENTION.

THE SPEECH SYNTHESIZER SCHEMATIC HAS SEVERAL ERRORS INCLUDING CR1 IS SHOWN BACKWARDS. THE ANODE SHOULD GO TO GROUND. ADD P2-8 SHOULD READ P2-10 (UNTIL YOU MAKE CORRECTIONS TO P2 CONN. CHART) AND RDU P2-9 SHOULD READ P2-4 AGAIN UNTIL YOU CHANGE THE P2 CONN. CHART. CR1 AND CR2 MUST BE INSTALLED WITH CORRECT POLARITY OBSERVED SO TO HELP, PUT A PLUS SIGN TO LEFT OF CR ON ASSEMBLY DRWG. AND ALL "+" REPRESENT THE CATHODE SIDE OF DIODES HERE.

P2	TECH	USE	CPU CONN.
1	32K	32K	U504 P. 3
2	32K	32K	U504 P. 3
3	32K	32K	U504 P. 3
4	32K	32K	U504 P. 3
5	32K	32K	U504 P. 3
6	32K	32K	U504 P. 3
7	32K	32K	U504 P. 3
8	32K	32K	U504 P. 3
9	32K	32K	U504 P. 3
10	32K	32K	U504 P. 3
11	32K	32K	U504 P. 3
12	32K	32K	U504 P. 3
13	32K	32K	U504 P. 3
14	32K	32K	U504 P. 3
15	32K	32K	U504 P. 3
16	32K	32K	U504 P. 3

THE SWITCH S4, THE SWITCH CONNECTIONS AND THE LED DRAWING ON THE RIGHT CAN ALL BE USED TO SELECT AND DESELECT AS WELL AS INDICATE WHICH OF THE CARTRIDGES ON GROM PORT IS IN USE AT ANY ONE INSTANT. CONNECT WIRES FROM THE POSTS ON S4 INDICATED BY LETTERS A-F AND B-F. SEE NOTE ON HOW TO ADD A FOURTH GROM CARTRIDGE WHICH WILL USE PF ON S4. JUST TRUST ME THIS WORKS! EXAMPLE: ATTACH A WIRE ON POST B OF S4 AND THE SAME WIRE TO A ON INTERNAL BO. S4 LOCATION 3 (S) AND ALSO TO LED AT TERMINAL B. THE SECOND POSITION ON THE ROTARY SWITCH 9 (S). THIS WILL MAKE THE SECOND LED. THE FIRST LED WILL BE USED TO LET YOU KNOW THAT NONE OF THE INTERNAL CARTRIDGES ARE ENABLED SO THAT A CARTRIDGE CAN BE INSERTED IN THE GROM PORT.

ROUTING THE RIBBON CABLE FROM CPU TO P2 CONN. CAN BE DONE BY CUTTING A 1/4" SLOT FROM FRONT EDGE OF TOP RF SHIELD OVER THE U506 AND U505 CHIPS. TAPE THE ROUGH EDGES TO PREVENT CUTTING THE RIBBON CABLE.

I HOPE THAT THESE DRAWINGS AND NOTES WILL AID ALL THOSE WHO PURCHASED AN INTERNAL BOARD TO CONSTRUCT IT AND ENJOY IT SOONER WITHOUT MUCH TROUBLE. BELOW ARE NOTES:

- NOTE 1. TO ADD A 4TH GROM PLEASE BACK IT (UP TO TWO HIGH) ON ANOTHER GROM PIN FOR PIN EXCEPT PIN 14. ATTACH A WIRE FROM PIN 14 OF THE 4TH GROM TO POST PF ON S4.
- NOTE 2. DO NOT INSTALL LEDS WITHOUT A 200 OHM RESISTOR IN SERIES.
- NOTE 3. THE SPEECH SYNTHESIZER HAS TWO ERRORS. BELOW U1 AND P2-8 SHOULD BE P2-10 AND BELOW U2 RDU P2-9 SHOULD BE P2-4. (ERROR ON SCHEMATIC)
- NOTE 4. MORE LATER

TI BASIC FOR BEGINNERS
by Harold Hiburn

BEGINNING PROGRAMMING ON THE TI 99/4A
IN THE IMMEDIATE MODE

Let's redo the keyboarding of last month to get a bit more experience.

Print Statement:

PRINT followed by a quote will cause all within the quote to be printed.

Try typing in the following: PRINT "THIS IS A MESSAGE" and press ENTER.

And PRINT "HI, THERE! I SPEAK BASIC, DO YOU?" and press ENTER

Try PRINT 344/2 and press ENTER

This last use of PRINT in the immediate mode causes the computer to solve the math problem (3 times four divided by 2) and print the answer.

We can use both of the these PRINT at the same time :

Try PRINT "2 Times 4 divided by 2 =" ; 344/2 and press ENTER

Also remember, CALL CLEAR followed by ENTER clears the screen of clutter.

ERROR MESSAGES:

You'll probably get many responses from the computer of INCORRECT STATEMENT. No problem, just check to see what's wrong and use the LEFT ARROW key (FCTN S) to back space over to make corrections; or, retype the complete line correctly. You can delete items from the line by using ARROW keys and delete with FCTN I.

LET Statement:

The LET Statement names and assigns values to variables.

Try LET A=5

LET A2 = B

LET ALPHA = 10

Note that the spaces around the equal sign can be used or not. The computer ignores this difference by removing them as not needed. But you must have the code after LET.

Now type PRINT A,A2, ALPHA,ALPHA/A

Note that the space ahead of the first ALPHA was self corrected by the computer. The use of the comma between multiple PRINT statements places the results in two fields of the screen. Also note that the computer still has the LET Statements in its memory. It will hold the data until you dump it or change it. Lets change ALPHA from 10 to 20. How? Its very easy.

Just type LET ALPHA=20

The last value entered replaces the earlier.

Now try PRINT A;A2;ALPHA;A/A2;ALPHA/A;A/A2;ALPHA/A;A/A2

The new value for ALPHA is there and the data can be used plus we even divided by a raw number, not in the memory. Also, using the semi-colon places the values to be spaced with only a double space between the values.

Just about anything can be used as a variable name up to fifteen characters. If we were to write a program to figure a bill we could just call it BILL.

Like, LET BILL = 25
And then PRINT "BILL =" ;BILL

The first BILL in quotes is printed with the enclosed = and followed by the value for BILL; in this case, 25

But what if tax had to be added?

Enter TAX = .065

Then, PRINT "BILL =" ;BILL+BILL*TAX

Maybe the charges of the BILL would have come from several sources, such as the following. And one further point, the TI doesn't need the LET to be printed. It looks for the equal sign to establish a value file and name. Type in:

MATERIAL = 10

LABOR = 10

PROFIT = 5

BILL = MATERIAL + LABOR+PROFIT

PRINT "BILL =" ;BILL+BILL*TAX

continued next month

TI-BASE - From INSCBOT
 TUTORIAL 12.1.1 By Martin Smoley
 NorthCoast 99'ers - Sept. 5, 1989
 Copyright 1989 By Martin A. Smoley

I am reserving the copyright on this material, but I will allow the copying of this material by anyone under the following conditions: (1) It must be copied in its entirety with no changes. (2) It is to be printed, credit must be given to myself and the NorthCoast 99'ers, as above. (3) The last major condition is that there may not be any profit directly involved in the copying or transfer of this material. In other words, you can use it in their newsletters and you can give a copy to your friend as long as it's free.

At this time, note (the way I write down) to support my TI-15 listing up out of my line. I will try and write a complete program (CSI) to keep you going until I can get back to or TI on a regular basis. It's sorry if the articles are a little slow, but it's the best I can do right now.

```

In this issue I have 3 CS that do almost the same thing, but not quite. Their difference is what makes them laborious. All three of the CS ask you for the time. They then print out the last time and date the CS has run and the current time and date you just entered. I created it because I was printing out several copies of the same report in one envelope and I couldn't tell the updates from the first printing. When the time of the log of each printed value is printed, this CS could be used for the last time you balanced your checkbook or paid your bills, etc. Create a very simple database used DT*TH or DT*TM depending on the CS you find in the USE statement in the CS you wish to use. The CS contains 3 fields. The first is named DT, type = B, with a width of 4. The second is named TH, type = C, with a width of 12. The CS will use this to store the time and date for whatever the next time the CS is run. The first CS (DOTM1) is the one I use. It will allow you to set the length of the DT*TH by appending an asterisk as you wish. In other words, you could keep the last two times and dates the CS was oldest record in the file and append the newest record to the end of the file. The interesting part of this CS is the use of TOP, BOTTOM, DELETE RECORD and PACK to hold the CS in a pre-determined size. MOVE -1 and MOVE are used to locate records to be printed.

TI-BASE - From INSCBOT
 TUTORIAL 12.1.2 By Martin Smoley
 NorthCoast 99'ers - Sept. 7, 1989
 Copyright 1989 By Martin A. Smoley

Another CS would be needed to print out any extra lines and dates in the DB. The CS in this article will only print out the last record and the current time and date. The word CS (DOTM2), works almost the same as the first except for the records read. DOTM2 works with your last two entries, but it keeps all of the previous entries. This CS would be great if you wanted to keep a complete record of the time and date a certain set of CS was used, but you must remember that each time you use the system DT*TH will get larger and therefore you will have less and less disk space for other types of files use.

DOTM2 Copyright Martin A. Smoley 1989
 Save current TIME DATE to DT*TH
 Continued Next Page.

DOTM3 is almost identical to DOTM2. It only saves two records and reads and prints in the same order. The real difference is that it holds data in its own variable space while it moves through the DB DT*TH to replace old data with current data. It created this CS to get away from the PACK command. In certain instances this algorithm will be faster. More important it does not place any system messages on your screen. This allows you to hold messages or menu selections in place on the screen without having these annoying system messages that scroll the screen up and down away the top line on the screen. I'm sure that most of you will find this a great idea.

Another idea which you may need from time to time is the selection of a unique number. Whether human selection or the random generation of a computer should be trusted with this task. Unique code numbers are the "trust" and at least two letters of a persons name. Some computers use title,date,zipcode and name. Take a look at some of your just call for numbers that might follow this pattern. I mentioned the unique number was because parts of these titles, date CS could be used to generate a unique number that you could then relate to a person or company name in a mailing list. This number could then be used to write the name and address together to gather alphabetical data. As I have shown in the past, it could also be used as an access code or for other information. In other words, any of these three CS could be converted to use you for the time and your access code. It could then save a record of who used the system, with the time and date. There are many many uses for any CS idea. The key need to slightly modify a particular CS for a new job, but it's easier than writing a new one.

TI SORT

I just put in a couple of slips for Instruct. They have created some great software for the TI and I think that TI Sort will be class behind TI Matrix and TI Date. I use it more and more as time passes. It is fast, accurate, and very versatile. If you work with any amount of data, I think you should pick up a copy of TI Sort for your collection of utilities.

TI-Base Ver. 2.03

I previously received version 2.02 for testing. I had a bad luck time to play with it when version 2.03 arrived at my door. Version 2.02 corrected a bunch of error problems on version 2.03 corrects several more. With the latest versions of TI-base you also have the ability to load from a hard drive and use a PATH function to find the TI-base main program files. You may never notice some of the problems that are constantly being corrected, but they are being corrected anyway. I bring this up because I feel that the TI community is getting more support from people like Dennis Flaherty than you can comprehend. It is a very small cost. Please try to support the efforts of our last main software supplier.

Continued Next Month.

Thanks to Jim Peterson for the
inspiration to write this utility. It
was fun!

Documentation for the token experiment.

First, a description of the assembly
support and then with the rest -

CALL LINK('TOK',N,LINE,TOKEN)

This routine looks at the whole Extended
Basic program to see if it contains the
total number of tokens or tokens (N),
an array of the line numbers (LINE),
and the tokens for each of the lines in
the array (TOKEN). To use this routine
as a standalone do the following. Old
your to program in, then from command
mode enter: TOK up to the assembly
number of tokens. CALL LINK('CALL LINK
(LINK('TOK',N,LINE,TOKEN),N,LINE,TOKEN)
to see an example of what can be done
with this utility. Naming 'TOK' dis-
plays every tokenized line of it in the
table program. You could use this data
to create a new program, etc.

The other line routine included allows
individual access to each ID line in
your program. CALL LINK('TOK',L,N,A,10)
passes the ID line number (L), the
routine and returns a 'token' in the
array where the ID line is and 'N' the
token's code stored in the array for
that ID line. 'TOK' runs from 10,
list the program first, 10000 contains a
line with a bunch of 'T's. Run the
program and answer with a number 1 thru
4. Something happens? Now look at
line 10000 it has changed, line 1 thru

4 was copied to line 10000!
Well, you can think of plenty of neat
tricks to do now. Remember, keep your
dummy lines to assign character lengths
and you will have no problems.
I also included a new ID routine called
'TOK' that prints the CPU token
printer, the so line, and the address of
the ID line table. Hope this stuff seems
to handy. Enjoy!
