

8408 (030)

NET 99er  
HOME COMPUTER USERS GROUP  
PO BOX 534  
HURST, TX 76053

Hello there! Fellow 99ers

NOTICE

Next meeting is the 11th of AUGUST  
at 9:00 AM at the Hurst Public  
Library. Hope to see you there.

NET 99ER USERS GROUP  
MINUTES JULY 14, 1984

President Leroy Thompson called the  
meeting to order, and said the next  
meeting was scheduled Aug. 11 at  
the Hurst Library.

Treasurer Charles Bathman gave a  
financial report of the group and  
reported the account had \$358.38.

There was a suggestion that the next  
meeting feature a demonstration of  
the disk fixer and Multiplan.  
Thompson also handed out correction  
copies of the Forth program that  
appeared in last month's newsletter.  
The AT signs were left off.

Mike Bowen gave a report on the SIG  
Multiplan group, and said the night  
of the meeting probably would be  
changed from a Wednesday to a  
Thursday. Charles Clines said the  
Extended Basic SIG would meet again  
July 26.

Thompson said that Ross Williams at  
the TI Exchange Center on Campbell  
Road in Dallas is the person to  
contact for technical help if any TI  
user is having problems with their  
equipment. Thompson also suggested  
that if a person is exchanging a  
computer, to be sure to take third  
party software (cartridges) to make  
sure they work on the computer TI  
gives you. Remember, some of the  
newer models (with a copyright 1983)  
won't run the third party (Atari,  
etc) software.

Thompson also announced that TI sent  
the group a package that included

the advanced assembly language  
debugger. And, he said, TI seemed  
interested in how the group was  
progressing with Forth, etc.

After a swap, buy and sell session,  
an impressive demonstration was  
given of Super Sketch by Steve  
Roubik of Personal Peripherals.  
It's the newest piece of software  
(it's an electronic tablet connected  
to a cartridge) and it allows a  
person to draw and color anything on  
the screen.

Roubik, who worked for TI for four  
years, said an enhanced package will  
be released sometime in the fall,  
and that this will allow dumping the  
graphics to a printer, among other  
things.

Many members signed up to purchase  
the package that will retail for  
about \$60.

Roubik has had hands in programming  
Honey Hunt for the Milton Bradley  
voice recognition system, and  
Facemaker.

He said by the time this newsletter  
is out, stores should have the  
program that's been available for  
other home computers for a while  
now.

After the demo, Thompson closed the  
meeting.

Respectfully submitted,

Secretary

PRESIDENT'S COLUMN

Summer is a good time for  
daydreaming and things like that.  
So . . . I would like it if this  
could be written to you on my new  
portable 99 computer while I was  
resting near the surf in Hawaii. I  
would type it in between dips in the  
ocean and then go to a phone booth  
to E-mail my story in to our editor.

Now, back to reality. This is  
really being written in Arlington,  
in a rush, just before going on a  
south Texas vacation. It's kinda a

come-down from the daydream, but we plan to have fun just the same.

As was stated in the meeting, I profoundly apologize to each and every one of you who tried the FORTH program from the last issue. Unless you are a FORTH expert, you couldn't make it run correctly. We managed to lose the 'at' signs. Notice how I didn't use that cursed symbol. What follows is a correction in words only. This is going to be hard to follow, but let's try together.

In line 2 of the screen the 'at' sign should be inserted (with spaces on either side) between the 'TT' and the '59'. In lines 3,4,5,7,8, the 'at' sign should be inserted next to the first 'C' but with a space between it and the '. In line 9 there need to be 3 insertions of the 'at' sign--immediately after the first, third and fourth 'C's. A space should follow these 'C's. In line 14, the 'at' sign should be inserted with a space on either side between the INTLNK and the apostrophe. I hope that with these changes you will be able to get the program to run. The data published with it last time certainly was a good explanation.

Here is a clever little program in XB which fits in the gray area between Extended BASIC and assembly language. This little program was originally published in Richard Roberts' column on STARTEXT. It follows with minor modifications.

```
110 CALL INIT
120 CALL LOAD(8196,63,248)
130 CALL LOAD(16376,67,85,82,83,79,
    82,48,8)
140 CALL LOAD(12288,48,48,63,255,255,
    124,24,12)
150 CALL LOAD(12296,2,0,3,240,2,1,48,
    0,2,2,0,8,4,32,32,36,4,91)
160 CALL LINK("CURSOR")
170 CALL COLOR(0,16,1)
```

LINE-BY-LINE EXPLANATION: (x means asterisk and ! means 'at' sign)

110-Loads XB assembly subroutines from module into low ram  
120-Points to start of REF/DEF table. 8196=>2004 63x256248=16376=>3FF8  
>2004 is the pointer, >3FF8 is the address to which it points.  
130-Futs the name of this program into the REF/DEF table. 16376=>3FF8 and is the start of the REF/DEF table. 67=C 85=U 82=R 83=S 79=0 82=R (6 bytes)  
48x2568=12296=>3008 the starting address of this program.  
140-This is the line which contains the new cursor pattern data. It may be changed to suit yourself. Merely convert the hex pattern to decimal and substitute. 12288=>3000 is the address for the start of data.  
150-Machine language program to do the work. 12296=>3008 and is the start of the program. (Pointed to by last two bytes of line 130).  
2,0 = LI R0, 3,240 = 3x256240 = >03F0 (Address of cursor)  
2,1 = LI R1, 48,0 = 48x2560 = >3000 (Pointer to new cursor pattern data)  
2,2 = LI R2, 8 = 8 bytes to write 04,32,32,36=BLWP !VMBW (>2024) use of VMBW util to write 8 bytes to VDF RAM  
4,91 = Return to calling program, in this case, XB.  
160-Looks at >2004 to find the beginning of the REF/DEF table. Branches to that table, looks for a program named "CURSOR", when found, branches to the address which is the last two bytes of that line. Then it branches to that address, and executes the program.

I certainly hope that this comes out better than the FORTH program from last issue.

I want to express great thanks for a very good program to Steve Roubik of Personal Peripherals Inc. His demonstration of the Super Sketch package available for the 99/4A was most interesting. It looks like a package which can be both fun and useful to many of us AND OUR FAMILIES. If you missed the program and are curious, find someone who did attend and ask them. The program seemed to be universally

enjoyed. (That is the first time I remember hearing applause for a program). We, as a group, wish to express many thanks to FPI just for having the faith to make this product available for us TI users. Let's support them. The Super Sketch package will be available at a discount price thru the User's Group for members only. Those who did not sign up at the last meeting should contact Charlie Bathman.

I know that I owe a thank-you to someone for this suggestion, but as usual I forgot who. We are going to start compiling information that is something like the CHEERS AND JEERS which is published in the Star-Telegram. It goes something like this. If, in your dealings with computer-related businesses (both local and mail-order) you encounter very good or very bad businesses, let us know. We will insist on having your name but will publish anonymously the comments. This will be a service to all your fellow members. We can start this off by sending CHEERS to the Babbage's in NE Mall. They are one of the very few local businesses who will give out our User's Group cards. It is a great help to us. Please support this idea as it can be a help to all of us.

We always knew that we had a good machine. Some of us never dreamed that it was as inherently accurate as it really is. This comment is based on a short blurb which was published in the July issue of MICROpendium. This test is a short program which takes the number 1.0000001 and squares it looping 27 times. This is equivalent to taking 1.0000001 and raising it to the 2 to the 27th power or 1.0000001 raised to the 134217728 power. The accuracy of our 4A rivals that of some mainframes and minis. Those computers that can use double precision must use it to come even close. Our friends with Apples and Commodores don't even like to tell us the answer that they got. The only thing which leaves you with any

doubts is that they (MICROpendium) never told us where the 'right' answer came from. The given answer is 674530.470741. The best accuracies of each of the computers which I have been able to test are given below. It is quite interesting.

Computer	Percent Error
TI 99/4A	0.0000226
Apple	1.36
HF 9845T	.002313
Commodore 64	*8.
IBM FC/FCjr (DP)	.00000001912
VAX 11/780	.000000014
CYBER 175	.0000157
PRIME	.000762
TI-59	.0000671
CC-40	.0000264
HF-41C	.0000000001

#### PERSONAL RECORD KEEPING USERS

MIKE BOWEN

Those of you who have the Personal Record Keeping module should review the newsletters from the HUGGERS Hoosier User Group. The NET 99er has these newsletters as well as those of several other user groups. There is a three part article in these newsletters called THE HEART AND SOUL OF PERSONAL RECORD KEEPING. The first part of article contains information on subroutines in the PRK module which can be called by TI BASIC. These subroutines allow your BASIC program to manipulate data bases built with FRK. The second part of the article describes the various header records and data records in a file built by FRK. The final part contains two BASIC programs which are examples of how to use the subroutines described in the first part. One of the programs takes a FRK data base and builds two files -- a file of header information and a file of the data. The other program takes files of these types and builds a FRK data base.

Using this formation it would be

possible to make changes to the FRK data base which you could not do in FRK. An example might be to reorder the file based on more than one field. Another example might be to rearrange the order of the fields in the record or to increase the size of a field. Also you could write your own specialized report program.

#### MULTIPLAN SIG MEETING NOTICE

This month's Multiplan SIG will meet Monday, August 13 at 7:15 p.m. The place of the meeting is the home of Mike Bowen at 905 Chattanooga in Bedford. Call Mike at 571-4956 for directions. The place and time of the next meeting will be discussed at this meeting. Some templates which have been donated to the library will be reviewed. The use of tables in Multiplan will also be discussed.

#### Charlie's Chatter

Well, I was very impressed by Steve Rubick's demonstration of SUPER SKETCH at our July meeting. From the response to our sign in sheet, so were a lot of our members.

During the interim there has been a lot of negotiation going on with various sources to see if we can buy SUPER SKETCH at a good price for our members. The only thing I can say for sure is that we do have a source and that the price will be under \$50. Just how far under \$50, I can't say for certain at this time.

Since we will have to purchase and pay for SUPER SKETCH in advance and we expect to have about thirty-five of them at the August meeting, we must ask that you bring a check to pay for your purchase. No Checky - -No Sketchy.

We will also have ATHANA Double Sided/Double Density diskettes available for \$25 per box of 10. The group had to buy 200 to get our best price. 50 have already been sold and paid for, the Group Library

needs at least 50 so there are a few boxes still available for our members.

Our Name Badge order has still not been filled since the fellow who makes them had to make a trip to Singapore. It's a tough life, I guess. He should be back soon but, I don't think it will be in time for the meeting.

With all the money the group and its benefactors have had to lay out for purchases this month, we will probably only be able to order some copies of Craig Miller's "Smart Programming Guide for Sprites".

Quite a few of you have ordered other books such as, BASIC TIPS, Introduction to Assembly Language For The TI Home Computer and Programs For The TI Home Computer. Until we receive payments from a few more of the members who have put their names on sign-up sheets for these books, we won't be able to order them. To those who have paid for them, I apologize for the delay. To those who have not yet paid for their order, please give me your payment at the next meeting.

Now, On to better things!!!!

I received an add from the 99/4A National Assistance Group and have decided to join. They offer Technical Assistance, Updates on new products, Discounts on hardware, peripherals and accessories, a Users Group and other benefits. Their address is P.O. Box 290812, Ft. Lauderdale, Florida 33329. Annual membership is \$10. After I have received their information and have had a chance to review what they really offer, I'll do a review in the newsletter.

Peter Rokkas, one of our members who operates TAPE RECORDER SERVICE at 616-A North Riverside Drive in Fort Worth (76111) has a very good deal for members on the Olympia Electronic Compact 2 typewriter/printer (see last month's

newsletter for a review). Give him a call at 834-5151 for details.

Speaking of the Olympia Compact 2, I had done some office forms with TI Writer and my Gemini 10 and I decided to use the Olympia to get a better looking original to make copies from. I had used the "!" (FCTN A) to make vertical lines on the form. When I used the TI Writer Formatter and ran the form on the Olympia, every place I had a "!" the Olympia printed a "1/4".

This made an interesting looking form but not what I needed. In reviewing the keys and ASCII codes for the Olympia I found that the "!" was in a special "shift" key set that is accessed only by holding down the Special KB II Shift Key and that wouldn't work while the computer was driving the Olympia printer.

What-to-do, What-to-do??? After a little more messing around, actually a lot more messing around, I found that by using the Transliterate command of TI Writer Formatter, I got the special shift characters to appear.

The Transliterate Command allows you to redefine one ASCII character into another ASCII character. I used:

[.TL 124:14,44,15

It works like this:

[.TL is the Transliterate command

124 is the normal TI ASCII code for "!"

":" means transliterate into

14 means SHIFT OUT, which in the case of the Olympia, means shift out of the normal characters and into the special characters.

44 is the ASCII code for the Olympia's special character "!" after the shift has been made.

15 means SHIFT IN, which means shift out of the special characters and back into normal characters.

It's really not all that difficult unless you don't have the Olympia "Computer Interface" supplement. If you do get one of these jewels, make sure you get both an Olympia Electronic Compact 2 instruction manual and the Interface supplement, otherwise you will get very confused.

My supplier (NOT Tape Recorder Service) tried to con me into believing that there was neither a special instruction manual nor an interface supplement for the Compact 2. Luckily, I didn't buy that. I called Olympia direct and got what I needed. Call me if you need addresses or phone numbers.

Well, so much for the technical garbage. Here's some good news.

New members since our last meeting are:
