FEBRUARY 1987

Newsletter

VOL. 5 No. 2

NH99UG NEWSLETTER - POB 5991 - MANCHESTER, NH 03108

>OLD

The last meeting opened with some tough news about our meeting place - Bonanza. In the past, we have been given use of the facilities and utilities at no cost. In return, we were asked to support Bonanza with a minimum purchase of meals. The minimum was ten, but no one really kept track (we have had at least ten purchases since I can remember). Recently, Bonanza has seen an increase of activity on Monday nights. In order to best utilize their rooms, we have been asked to 1) meet earlier and end earlier! and 2) purchase a minimum of eighteen meals.

Meeting early was something I wanted to propose anyway. A show of hands voted to change the meeting hours to 6:30 PM - 9:00 PM; meaning we are out the door by 9:00!

The eighteen meal requirement will be tougher to swallow (I couldn't resist). This is how it works: the club has to pay Bonanza the price of a meal (\$4.50) to make up the difference between what club members bought and the eighteen minimum. This is certainly reasonable from a room rental perspective. However, \$20 to \$30 a month will tap our account very heavily.

REQUEST:

Since the meeting is starting at 6:30 and you will pay for room rental either through meals or increased club dues: I request that you dine at Bonanza the night of the meetings. I realize everyone can't do this every night (I haven't been a regular diner in the past) and completely understand. Please make an effort, though, to dine there when you can on meeting nights.

Thanks from the bottom of the club's treasury.

The main demonstration was INFOCOM's ZORK I text adventure. Scott Adams' Return to Pirate Isle (text and graphics) was also demo'd.

Another demonstration was given: how to take apart a dot-matrix printer. Hopefully we can have a good demo in the future on how to put it back together (and have it work). Seriously, there was some surgery performed and the patients finally recovered by the end of the meeting.

>NEW

Next month I will disassemble one of my consoles and show you what the various parts are and what they do. I hope I will also show you how to get it back together so it works.

I will also give the first in a series of lessons on BASIC (and Extended BASIC). As was pointed out during February's meeting, there are many people who are struggling with the finer points of the BASIC's. Since the purpose of the club is to support you - and the need is very strong for support in BASIC - I will be more than happy to oblige.

Watch for articles on BASIC topics not only in this newsletter, but also MICROpendium. We will also cover other languages as people ask for them.

CORRECTION:

Later in this newsletter, Helene mentions that I couldn't get on the Progressive Connection. That is now longer true. It seems that there are some phone line problems which require that I make several attempts before a successful connection. Anyway, the board is up and running, and the TI section is coming back to life. Note that the only number currently available is 644-3507.

There is also Gary Blydenburgh's PRO 99'er BBS at (617) 664-8668. Gary not only runs a good board, he is also a dealer of MYARC hardware and software. If you are thinking about a purchase of equipment or software, please give him a call. His prices are very competitive and his service to you is incredible! I purchased a MYARC memory card through him that was missing an optional chip (which I paid for). I notified Gary and had the chip in my hands the next morning! Try to get TENEX or TRITON to respond like that!

The annual FAYUH is this April 4th at the Waltham High School. Admission is \$3 for adults, \$1 for kids 5 to 12. Children under 5 aren't allowed (actually you can bring them for free - just don't come around my booth). FAYUH times are 10:00 AM to 6:00 PM. An announcement from the Boston Computer Society (TI-99/4A User Group) newsletter is printed herewith.

>BYE

Fayuh Time

And on a more serious note, the Second Annual New England TI Fayuh will be held on Waltham High School, on April 4, 1987 from 10 AM to 6 PM. Admission is \$3 for adults, \$1 for kids over 5 to 12 and free for kids under 5. There is a fair(e) chance that the price of admission will be slightly higher, but nothing serious. Despite serious attempts to the contrary, it will be a decent event, well worth your time to attend. Even if you have to drive down from Maine, or up from New Jersey. The point here is that this show will be on a par with other major national shows.

People/companies who are scheduled to attend include Tom Freeman, Terrie Masters, George Steffan, Clint Pulley, Asgard Software, Rave 99, Disk Only Software, Texaments, Delphi, Compuserve, Video Electronics Market Place, Jonathan Zittrain, Genial Computerware, Lou Phillips of MYARC, Paul Charlton, Jim Horn, J. Peter Hoddie (gasp), Barry Traver, Howie Rosenberg, Cheryl REGENA Whitelaw, Franz Waggenbach of T.A.P.E., Bruce Ryan of Ryte Data, and many more. Local lumenaries include Joyce Corker, Curtis Provance, Walt Howe, Bruce Willard, and so many more that we just don't have room to list them <grin>. There will also be user groups present from around the New England area including Boston (that means us), Rhode Island, Connecticut, Worcester, Andover (MAGNETIC), Maine, New Hampshire, and other groups from around the area. Is this gonna be fun? Did TI lose millions on this machine? You bet!

Sorry, all those articles you wrote must still be in the mail.

Don't worry about it - we can save paper and postage expense if we reduce the size of the news letter.

Besides, no one is really interested in C, FORTH, LOGO, MULTIPLAN, PILOT, Extended BASIC, RAM disks, hard drives, events, books,

Right?

Because of our reputation in the TI community, a MAJOR SOFT/HARDWARE WAREHOUSE contacted us to help them liquidate their remaining TI inventory. The items on this page are top quality, and all, but the individual cartridge software is TI factory-sealed! Since we are "kitchen table entrepreneurs" we do not accept credit cards, and must insist on payment by Money Order, Certified Check, or United Parcel Service C.O.D. If you have any questions, please call Helene (1-603/472-3369) from 7pm to 10pm (Eastern) any day except Saturday.

ALL TI PRODUCTS ARE SOLD WITH FACTORY WARRANTY ONLY AND MUST BE RETURNED TO TI FOR ANY WARRANTY CLAIMS OR REPAIRS

ALL SALES ARE FINAL. ORDERS REMOVED FROM WAREHOUSE AFTER PAYMENT ARE CONSIDERED COMPLETE.

DOMESTIC ORDERS: Postage & Handling: 10% of total order (\$3.00 min.). Excess postage will be refunded. C.O.D. add another \$2. Payment by Certified Check, Money Order or C.D.D. (U.S.). Please include your street address and phone number.

FOREIGN ORDERS: Postage & Handling: 20% of total order (\$5.00 min). Excess will be refunded. We will ship Insured Mail where postal regulations allow, however, WE ARE NOT RESPONSIBLE FOR UNINSURED PARCELS! Payment MUST be made via Certified Check or Money Order in U.S. funds.

RANDOM RAMBLINGS

Helene M. LaBonville (C)
New Hampshire 99'ers User Group

OK... Blame me this time... yes, it's my fault that the newsletter is late! I'm writing this on the 2/26, the same day that I bought an IBM clone, which is sitting in the living room unopened so that I can get this column to Curtis!!

PRINTERS I know I have been on a soapbox regarding the purchase of printers, but I am usually the first one consulted when there is a problem... even with those that I had no part in selling! There is a fantastic lure in purchasing the least expensive units possible, but PLEASE realize that you usually pay a a far higher price in the end. The keys to look for (my opinion) are ribbon replacement, adjustable tractor feed, Epson compatibility. If any one of these elements are missing... forget it!! I have spent countless hours in 1987 alone to obtain obscure ribbons for some of my clients.

You have no doubt noticed that my column has, in the last six months, been somewhat geared to promoting HAC LAB wares. Well, there is good reason for this, as I am HAC LABS. I sell products which I find interesting, have tested, and find a superior buy. Having fielded your inquiries I feel that I have a pulse on your computing needs and have attempted to stock my business with the products which hopefully address them. I do not sell any item which conflicts with the sale of NH99UG MARKETPLACE items... just wanted you to know!

I also, just today, bought 11 STAR MICRONICS LV1210's whose cartons were damaged in transit. I got a great deal on them and will pass the savings on to YOU! Because of the damages these are not warrantied, however, cursory inspection shows little damage to the printers themselves. I can't tell you how much I can sell them for, as yet, because I haven't had the opportunity to test each one. I can tell you that I have used this model at my second system, where my niece has produced excellent school reports. The printer speed is 120 characters in draft and features NLQ (really nice), sub/superscript, ultra hi resolution bit image graphics, vertical and horizontal tabs. Paper feed is friction and tractor, plus, the unit comes with a roll paper shaft. Ribbon used is the standard 2" two-spool underwood type. If you are interested please give me a call.

By the way, the best time to get in touch with me is from 7pm to 10pm most evenings (except Saturday). Please, because of the extremely low markup on the items that I sell... I can not return your toll calls! Please respect this, as I cannot afford to keep the prices at this level and still provide you with the services which you have been accustomed to. Some of the items which I sell have come as a direct result of other computer

retailers going-out-of-business liquidations. We have been biting the hands that feed us!

The LV1210 is no longer being produced by Star Micronics and it has been replaced by the NP-10 which is the younger brother to the NX-10. The NP-10 is the low end of the Star totem pole... but just a year ago, it would have been touted as an innovation! At just \$189 (+S/H) this unit has more features than the SG-10! such as reverse top-of-form, forward and reverse micro feed and NLQ selection front top panel, and Epson FX85 compatibility! Nice, nice printer!!!

One of the latest editions of the San Antonio TI Newsletter features a list of printer commands for various printers. I had hoped to have an addendum prepared for this this edition of the NH99UG Newsletter, but... . Look for it next month.

BULLETIN BOARDS Just after we reprinted the sampler logon session to the Progressive Connection it went down twice. The first time the hard drive crashed and destroyed most user info and much of the last years bulletins. Unfortunately, the info was backed-upped on high density floppies. Our experience has proven that this was a costly error. High density media is required by AT systems and is not downwardly compatible to the TI, COCO, or in Fritz' case, the Model4. The info was essentially vaporized! The board was again downed in January and since that time has been in the process reconstruction. The only active line at present is the 644-3507 number. Curtis has not been able to logon through this number (from either Merrimack or Nashua) . I haven't had any difficulty from Bedford. Unfortunately, the Texas Instruments SIG Forum now sports bulletins on Muscial Instruments! So much for bells and whistles!

I kinda think that I am the jinx in this case because the crash followed the sampler... just last month I prepared a similar sampler for a local Commodore board and after it was published one of its drives crashed!

MONITORS If you plan on purchasing the Myarc 9640 (Geneve) be on the lookout for ANALOG RGB monitors to get the full impact of the new colors. The Magnavox models 8CM8505 and 8CM8515 are great choices because they also have RGB I input as well as composite video. Other RGB A monitors include the Tandy CM-8, Sony 11 CR series, and the Teknika MJ305. More should surface soon as several other computer manufacturers are going the analog route.

SUPPLIES Remember that the club sells only top quality NASHUA diskettes at a SUPER PRICE of only \$7.75 for a box of 10 MD DSDD. Contact Treasurer Richard Guimby at the meetings.

SEARS (Nationwide) is selling a decent secretarial chair for \$30. I bought four! They have them on display... check them out.

REVIEW OF TI99/4A INTERN

BY CURTIS ALAN PROVANCE
NEW HAMPSHIRE 99'ERS USERS GROUP

About one year ago, I disassembled the console ROM to see how it works. Naturally, I found the task to be somewhat difficult, having never printed the listing - I worked on individual files through the TI-WRITER editor. When I read that TI 99/4A INTFRM by Heiner Martin not only listed ROM, but GROM as well, and the code was documented, and GPL was explained - for about \$18 - I thought I had died and gone to Heaven!

I'm here to say that it was a short trip.

The book itself is softcover and 208 pages long. As to the quality, I have three or four pages which didn't print very well, making the text difficult to read in spots. The text itself was translated from the German original and for the most part was done rather well. There are numerous spelling and grammatical mistakes, but nothing that you can't figure out. I don't think anyone would have a problem there.

The book is divided into sections of short descriptions and ROM or GROM listings. The short discussions mention such things as the GPL interpreter, the interrupt routine, sub routines, etc. The ROM and GROM listings are for only one version of the console, since there are only subtle changes from one console to the next.

I found the ROM and GROM listings very disappointing. While major portions of code are generally highlighted (such as the interrupt routine), individual lines are not. For the most part, this is not too much trouble; I can figure out that a SWPB between MOV8's gets a byte into the MSB position. However, there are portions of code where a command doesn't seem to do much of anything or else does so much that I have to add my own documentation. If I wanted to do that, I would have finished my own disassembly.

GPL, which is a byte oriented language, is described somewhat in the latter part of the book. The various GPL commands (all bytes) are listed, as well as what arguments they require (if any). This is certainly something that was previously not available to me. Unfortunately, the GROM listings suffer from the same malady as the ROM listings though to a much lesser degree. Actually, the GROM listings are documented almost line by line - though I question the value of many of the comments. For example, the mnemonics Mr. Martin uses for increment are INC (for a byte increment) and DINC (for a data increment). At one point in the code, address >832A, which points to the end of a line (in input) is incremented; the description follows:

DINC @>832A End plus 1

Thank you for that revelation; I couldn't have figured that out by myself.

TI99/4A INTFRM is available from catalog firms for ~\$17.95 (plus shipping, usually). If you really want to know something about GPL, it may be the only resource available for some time. Is it worth the \$\$\$? In my opinion, it isn't worth more than \$10, and that is clearer than any statement you'll find in the book.

RULE #1:

Do not develop programs at the keyboard. Your program should be written on paper and debugged before you turn on the computer. This provides a hardcopy right from the beginning, and allows you to make corrections without potentially disturbing the rest of the program. You will also find that pencils don't heat up after several hours like TI's do.

RULE #2:

Never write the same code twice unless it is very short (one or two lines). You are wasting typing time and adding unnecessary bytes to your program. A routine that is used twice or more (such as a key scan routine) should be placed in GOSUB. **COROLLARY:** if a routine is used only once, do not use a GOSUB for it; that just wastes time and space and makes the program more difficult to read.

RULE #3:

Use meaningful variable (and constant) names. Unless you are really strapped for memory, your names can be spelled out. I realize this uses extra bytes (flies in the face of #'s 1 and 2), but it will make the program much easier to read a year from now.

RULE #4:

Assume the person running the program knows nothing! If you have ever run an 'unfriendly' program written by someone else, you know what I mean. If the user is restricted to input one of three values, display what the allowable values are. Then don't accept poor values which will cause an error later. Remember, you may be your own 'stupid' user a year after the program is written.

RULE #5:

Expect the user to totally screw up. Yes, you should write in error recovery (or traps) as much as possible. We will examine some techniques in this area.

BASIC has oftentimes been maligned as a serious language. Advocates of FORTRAN, PASCAL, and other 'structured' languages, complain that a program written in BASIC is difficult to read and understand because the program control jumps from section to section. The term 'spaghetti code' was coined to represent a typical BASIC program with dozens of GOTO's, GOSUB's, and IF THEN ELSE's.

Admittedly, many of the programs written in BASIC are poorly done and can't easily be read by the author, not to mention anyone else. This is a fault not of the language, but of the programmer. If BASIC has a fault, it is only that its simplicity allows sloppy code - it doesn't encourage it!

I claim that BASIC - and extensions thereof - are powerful languages which may provide clear, understandable code.

We will explore programming in BASIC and the guidelines I use when I program. If you disagree, please write; I will be happy to print opposing viewpoints.

Printed this month is the disk jacket program I wrote almost two years ago. I can still pick it up today and understand how it flows. Although I am leaving you with the program this month, we will reference it in the following months as part of a BASIC tutorial. A sample of the output is on the last page of the newsletter.
